3

Data Sample

- Aim: integrate 50-100 ab^{-1} of data (at least $10\text{ab}^{-1}/\text{yr}$).
- Two orders of magnitude larger data set than the current B-factories:
 - i.e. 110 Billion $B\bar{B}$ pairs operating at the $Y(4S)$.
 - Similar numbers of D mesons and τ leptons.
 - Can run at different \sqrt{s} , e.g. $Y(5S)$ for B_s physics.
- New concepts in accelerator technology should enable us to meet this target within 5 years of data taking.
 - Accelerator R&D is well underway at Frascati to test these concepts.
- Timescale: Aim to start taking data 5 years after funding gets approved.

Physics Case – in a Nutshell

- We expect New Physics (NP) at the TeV scale:
 - Same motivation as the LHC!
- This physics will have some kind of flavour structure:
 - Rich structure: *we have to measure it!*
 - Trivial structure: *we have to confirm!*
- This new physics may, or may not help elucidate the matter-antimatter asymmetry problem.
- SuperB can make complementary measurements to the LHC programme:
 - Many rare decay final states are only accessible to SuperB.
 - Sensitive to off-diagonal terms in the squark mixing matrix.
 - Test Lepton Flavour Violation (LFV) in τ decay.
 - Can study CP and CPT violation in τ decay, τ anomalous magnetic moment.
 - Search for CP (and CPT) violation in D decays.

What do we mean by flavour Structure?

- The relationship between generations of particles (quarks, squarks, leptons).
- Using quarks as an example:

$$W^+ \rightarrow i \frac{g}{\sqrt{2}} \gamma_\mu \gamma_L V_{ij} q_j$$

$q_i = u, c, t$ (red line)
 $q_j = \bar{d}, \bar{s}, \bar{b}$ (blue line)

Relative magnitudes

	d	s	b
u			
c			
t			

- These gauge interactions form a 3x3 unitary matrix called the Cabibbo-Kobayashi-Maskawa CKM matrix.
- The CP conjugate interactions have couplings with factors of V_{ij}^* .

$$V = \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix}$$

Aside: \mathcal{P} , \mathcal{C} and \mathcal{T}

- \mathcal{P}
 - Mirror reflection, with a rotation of π about an axis perpendicular to the reflection plane.
- \mathcal{C}
 - Change particle to antiparticle.
- \mathcal{T}
 - Reverse the direction of time.

$$\mathbf{r} \rightarrow -\mathbf{r}$$

$$\mathbf{p} \rightarrow -\mathbf{p}$$

$$\mathbf{L} \rightarrow \mathbf{L}$$

$$e^- \rightarrow e^+$$

$$\gamma \rightarrow \gamma$$

$$t \rightarrow -t$$

Testing Flavour Structure

- In addition to measuring rates of flavour changing transitions, we can probe flavour structure using asymmetry observables:

$$A = \frac{\bar{N} - N}{\bar{N} + N}$$

- Integrating over all signal events (e.g. $B^0 \rightarrow K\pi$)

The difference between the blue and red curve indicates CP violation in this particular decay.

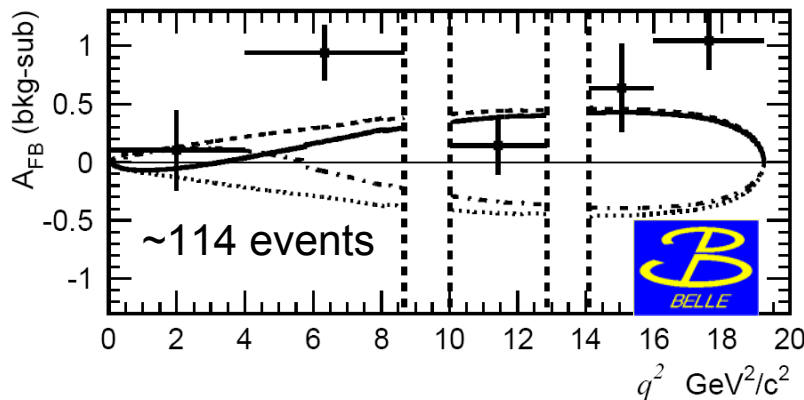

Testing Flavour Structure

- In addition to measuring rates of flavour changing transitions, we can probe flavour structure using asymmetry observables:

$$A = \frac{\bar{N} - N}{\bar{N} + N}$$

- Integrating over all signal events (e.g. $B^0 \rightarrow K\pi$)
- As a function of some kinematic variable (e.g. $b \rightarrow sll$)

The shape and features of the forward backward asymmetry in $B \rightarrow K^* l l$ is sensitive to new physics in FCNC.

Solid line = SM prediction
 Dotted line = sign flip C_7
 Dashed line = sign flip $C_9 C_{10}$
 Dot-Dashed line = sign flip both

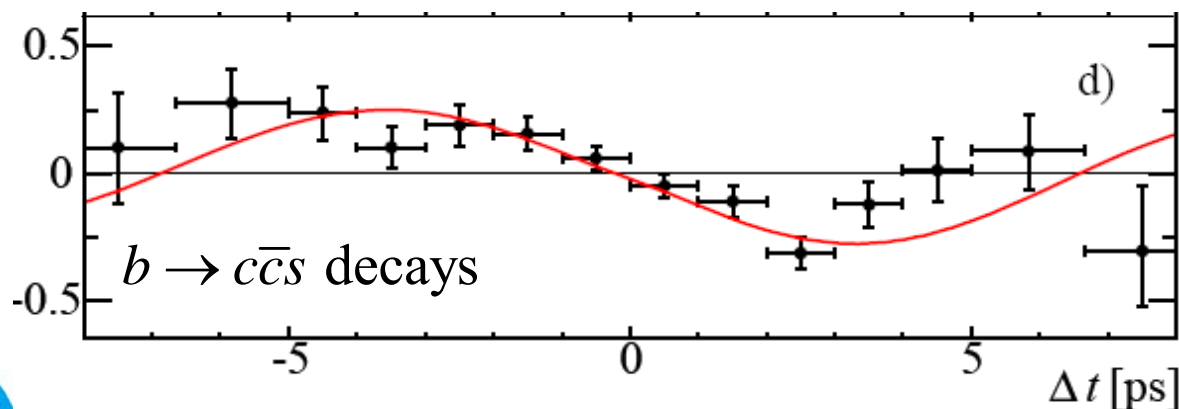

Testing Flavour Structure

- In addition to measuring rates of flavour changing transitions, we can probe flavour structure using asymmetry observables:

$$A = \frac{\bar{N} - N}{\bar{N} + N}$$

- Integrating over all signal events (e.g. $B^0 \rightarrow K\pi$)
- As a function of some kinematic variable (e.g. $b \rightarrow sll$)
- As a function of the time difference between a known flavour state decaying, and a tagged flavour state (neutral mesons only) (e.g. $B \rightarrow J/\psi K_S^0$).

The sinusoidal oscillation indicates CP violation in this particular decay. Sine and Cosine amplitudes in this plot indicate two different types of CP violation.

Putting the existing programme into perspective

- The current B factories have measured the unitarity triangle.
 - Both BaBar and Belle have outperformed expectations:
 - Observed CP violation in the B system.
 - Evidence for oscillations in D system.
 - Measured the characteristics of the unitarity triangle beyond expectations.
 - Discovered a number of low energy hadronic states.
 - And performed a large number of other measurements besides this... with more than 540 publications since 1999.
- The Tevatron has discovered mixing in B_s decays.
- LHCb will start taking data soon, and will overconstrain the Unitarity Triangle.
- So ...
 - ... Standard Model tests will have been done to a high precision before a SuperB starts taking data.

Today's calibration channel is tomorrow's background

IPPP, October 2007

Adrian Bevan
<http://www.pi.infn.it/SuperB/>

12

**Today's calibration channel
is tomorrow's background**

**Today's golden channel is
tomorrow's calibration mode**

- Unitarity Triangle will be well measured at SuperB.
- The angles and sides are calibration measurements, required in order to search for NP.

**Today's calibration channel
is tomorrow's background**

**Today's golden channel is
tomorrow's calibration mode**

**Tomorrow we look for
new physics**

Adrian Bevan

<http://www.pi.infn.it/SuperB/>

IPPP, October 2007

14

New Physics Search Capability

IPPP, October 2007

Adrian Bevan
<http://www.pi.infn.it/SuperB/>

15

New Physics in Loops ($\Delta F=1$)

- Rare loop processes can have significant NP contributions.

- NP can modify the expected SM amplitudes and asymmetries.
- Want to look in as many different modes (and with as many different observables) as possible.

New Physics in Loops ($\Delta F=1$)

- β_{eff} measured in $b \rightarrow s$ penguin decays can differ from β in $b \rightarrow c\bar{c}s$.
- Small uncertainties come from SM corrections to the decays.
 - $O(0.01)$ on $\sin(2\beta_{\text{eff}})$ in $\eta'K^0$ and $3K^0_S$.

some of recent QCDF estimates
 $\sin 2\beta_{\text{eff}}^f - \sin 2\beta$

QCDF: (Beneke, PLB620 (2005), 143-150, Cheng et al., PRD72 (2005) 094003 etc.
 SCET: (Williamson & Zupan, hep-ph/0601214)
 Can estimate ΔS and mostly see a positive shift.

SU(3): Grossman et al, PRD68 (2003) 015004; Gronau et al, PRD71 (2005) 074019; ...).

SM corrections to $b \rightarrow s$ penguin decays tend to prefer $\beta_{\text{eff}} > \beta$.

New Physics in Loops ($\Delta F=1$)

- β_{eff} measured in $b \rightarrow s$ penguin decays can differ from β in $b \rightarrow c\bar{c}s$.
- Small uncertainties come from SM corrections to the decays.
 - $O(0.01)$ on $\sin(2\beta_{\text{eff}})$ in $\eta'K^0$ and $3K^0_s$.
- Large deviations from SM expectation would indicate NP.
 - Discrepancy decreases year by year!
 - Need to perform precision measurements on a mode-by-mode basis!
- SuperB will be able to probe these asymmetries on a mode-by-mode basis to the level of current SM uncertainties ($>50\text{ab}^{-1}$).

$$\sin(2\beta^{\text{eff}}) \equiv \sin(2\phi_1^{\text{eff}})$$

LP 2007
PRELIMINARY

New Physics in $\Delta F=2$ Transitions

- $\Delta F=2$ transitions in $B_{d,s}^0 \bar{B}_{d,s}^0$ systems are box diagrams (mixing or FCNC).

$$q = d, s$$

New Physics in $\Delta F=2$ Transitions

- $\Delta F=2$ transitions in $B_{d,s}^0 \bar{B}_{d,s}^0$ systems are box diagrams (mixing or FCNC).

- NP can contribute to these processes.
 - Parameterise with an amplitude ratio C_q and phase ϕ_q .

$$C_q e^{i\phi_q} = \frac{\langle B_q^0 | H_{SM+NP} | \bar{B}_q^0 \rangle}{\langle B_q^0 | H_{SM} | \bar{B}_q^0 \rangle}$$

- $C_q=1$, and $\phi_q=0$ for the SM.

New Physics in $\Delta F=2$ Transitions

- Existing measurements already constrain NP in B_d mixing.

New Physics in $\Delta F=2$ Transitions

- Existing measurements already constrain NP in B_d mixing.
- SuperB will significantly improve this constraint.

Note that the two plots have very different scales!

Minimal Flavour Violation

- Suppose that there are no new physics flavour couplings (MFV).
 - CP violation comes from the known SM Yukawa couplings.
 - The top quark contribution dominates the SM.
 - NP contribution in $\Delta B=2$ transitions is:

$$\delta S_0 = 4a \left(\frac{\Lambda_0}{\Lambda} \right)^2$$

SM Scale ~ 2.4 TeV
 $\Lambda_0 = Y_t \sin^2 \theta_w M_W / \alpha$

Real Wilson coefficient $O(1)$ New Physics Scale

- MFV Includes many NP scenarios i.e. 1HDM/2HDM, MSSM, ADD, RS.
- What is the energy scale that we are sensitive to?

Minimal Flavour Violation

- Sensitive to new physics contributions with Λ up to 14 TeV ($= 6\Lambda_0$).
- For loop mediated NP contributions the constraint can be weakened so that $\Lambda \sim 700\text{GeV}$. 
- Don't require that the EWSB scale match Λ .
- e.g. 2HDM with small $\tan\beta$ allows a sub-TeV search for NP in $B^+ \rightarrow \tau^+ \nu$. If we allow for larger $\tan\beta$, the NP search is $3 \times$ more sensitive.

B \rightarrow $\tau \nu$

- Higgs mediated MFV:

$$r_H = \frac{\mathcal{B}_{SM+NP}}{\mathcal{B}_{SM}}$$

- Multi TeV search capability for large $\tan\beta$.

SUSY CKM

- The SM encodes quark mixing in the CKM matrix.

- SUSY encodes squark mixing in a Super CKM equivalent of the CKM matrix: V_{SCKM} .

Let us now consider a MSSM with generic soft SUSY-breaking terms, but **dominant gluino contributions only**

- Have couplings for LL, LR, RL, RR interactions.

- LHC probes the High Energy Frontier.
 - Measures the diagonal elements of V_{SCKM} .
- SuperB probes the Luminosity Frontier.
 - Measures the off-diagonal elements V_{SCKM} .

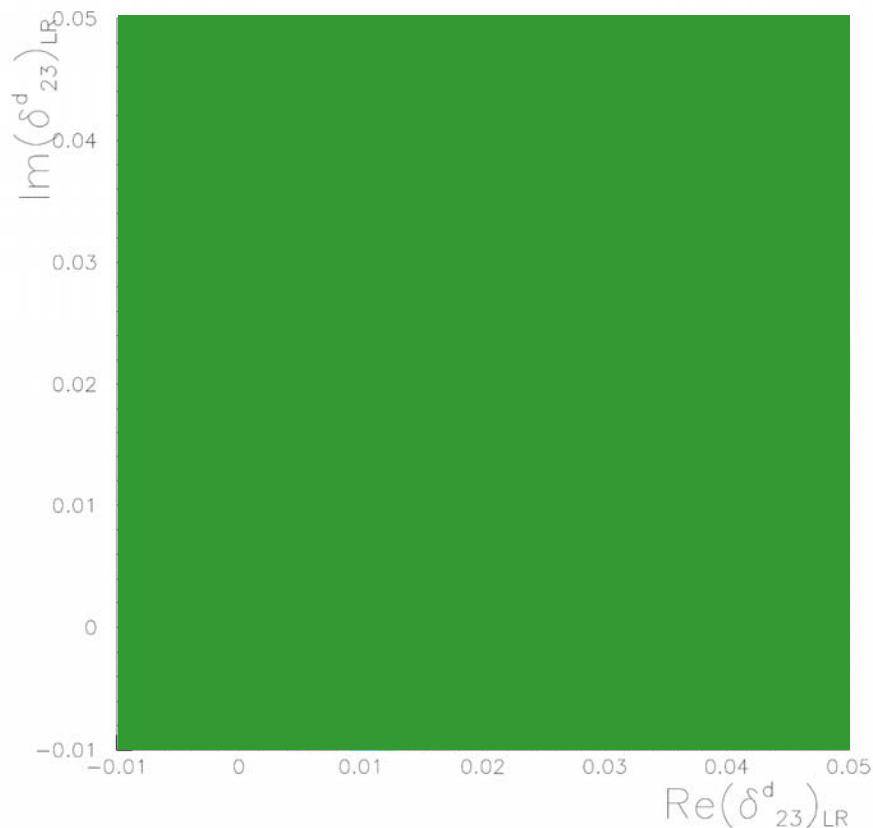

SUSY CKM

L. Silvestrini (SuperB IV)

- Couplings are $(\delta_{ij}^q)_{AB}$ where $A, B=L, R$, and i, j are squark generations.
- e.g. Constrain parameters in V_{SCKM} using:

- $\mathcal{B}(B \rightarrow X_s \gamma)$ [green]
- $\mathcal{B}(B \rightarrow X_s l^+ l^-)$ [cyan]
- $A_{CP}(B \rightarrow X_s \gamma)$ [magenta]
- Combined [blue]

SuperB probes new physics in SUSY larger than 20TeV (and up to 300TeV in some scenarios)

With current data, the whole range shown is allowed!

SUSY CKM

- Couplings are $(\delta_{ij}^q)_{AB}$ L. Silvestrini (SuperB IV)
where $A, B=L, R$, and i, j are squark generations.

- e.g. Constrain parameters in V_{SCKM} using:

- $\mathcal{B}(B \rightarrow X_s \gamma)$ [green]
- $\mathcal{B}(B \rightarrow X_s l^+ l^-)$ [cyan]
- $A_{CP}(B \rightarrow X_s \gamma)$ [magenta]
- Combined [blue]

SuperB probes new physics in SUSY larger than 20TeV (and up to 300TeV in some scenarios)

With current data, the whole range shown is allowed!

τ Decays

IPPP, October 2007

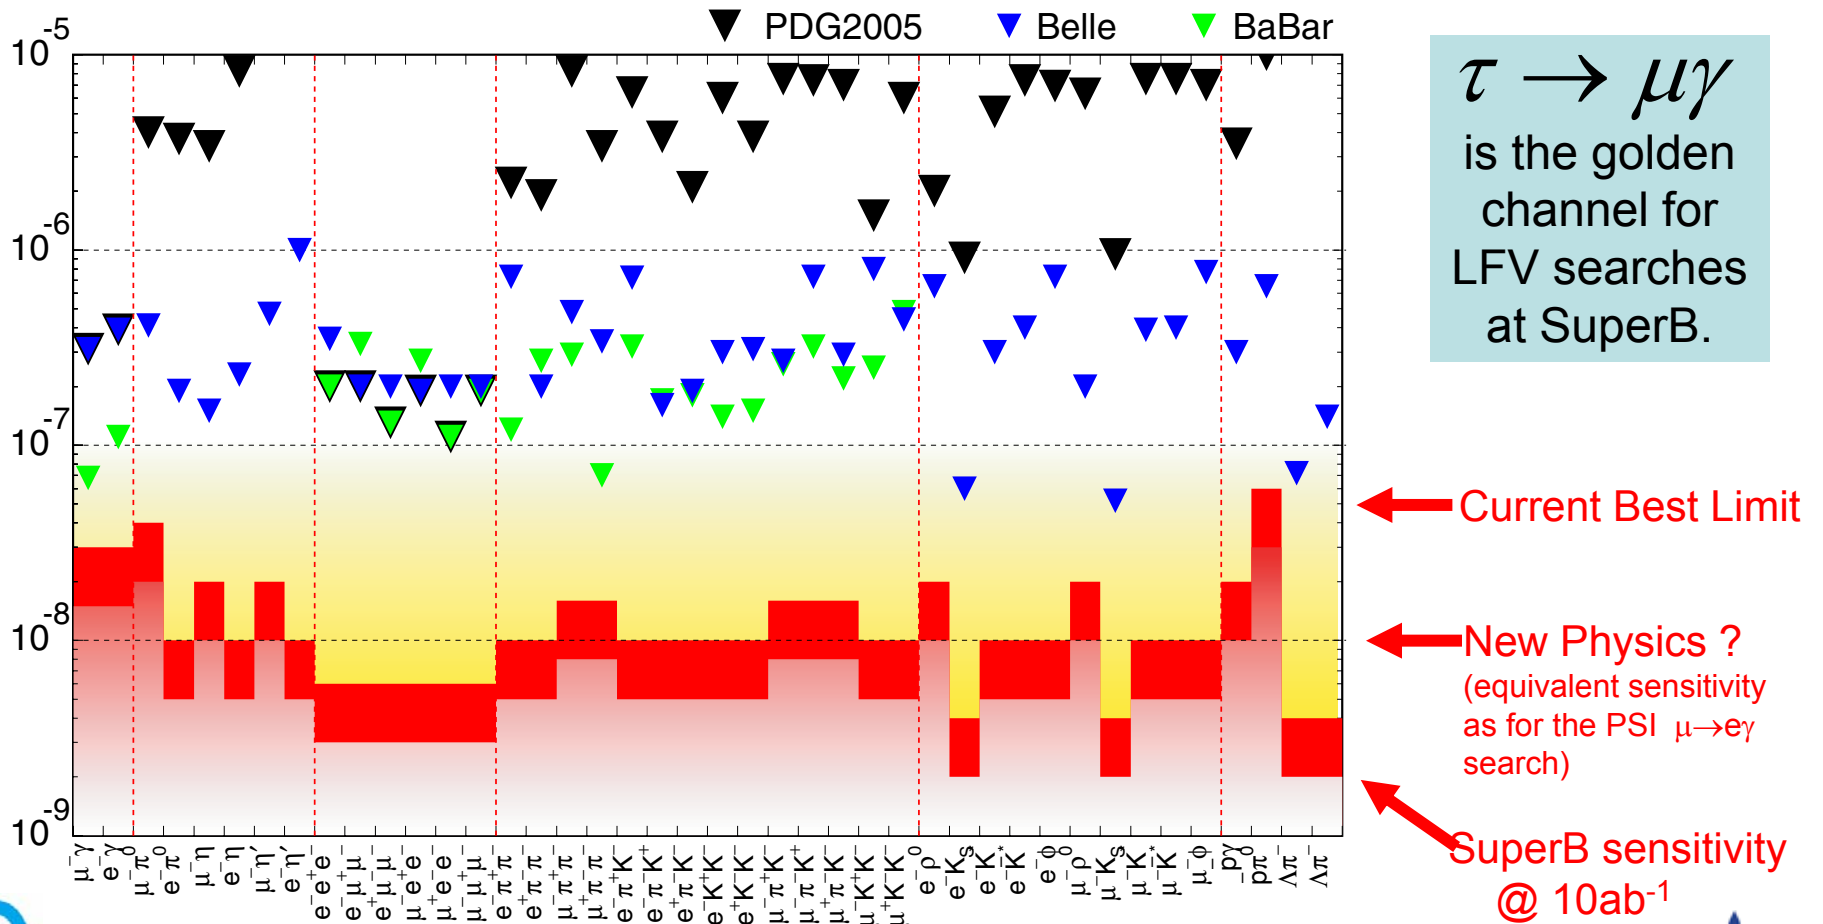

Adrian Bevan
<http://www.pi.infn.it/SuperB/>

29

Lepton Flavour Violation

- SUSY breaking at low energies should result in FCNC [e.g. $\tau \rightarrow \mu \gamma$, $\mu \rightarrow e \gamma$].

CP and CPT Violation

- CP Violation.

- SM decays of the τ have only a single amplitude – so any CP violation signal is an unambiguous sign of NP.
- e.g. Can have NP contributions from a H^\pm in $\tau \rightarrow N\pi\nu$, $N=3,4$.

e.g. see Datta et al., hep-ph/0610162

- CPT Violation.

- Expect to be able to measure $\frac{\tau_{\tau^-} - \tau_{\tau^+}}{\tau_{\tau^-} + \tau_{\tau^+}}$ at the level of 10^{-4} (statistical).
- Current bound is $(0.12 \pm 0.32)\%$.

Nucl. Phys. Proc. Suppl. **144** 105 (2005)

- Polarisation of e^+e^- beams benefits the search for CP and CPT violation in τ decay and the τ anomalous magnetic moment.

e.g. PRD **51** 3172 (1995);
arXiv:0707.2496 [hep-ph]

Accelerator Aspects

IPPP, October 2007

Adrian Bevan
<http://www.pi.infn.it/SuperB/>

32

Target Integrated Luminosity

- Why 50-100ab⁻¹ of data?
 - Many of these new physics searches become systematically or theoretically limited.
 - e.g. time dependent asymmetry measurements with b→s penguin decays).
 - This data sample represents two order of magnitude improvement in sensitivity over current experiments.
 - The current B-factories have 1ab⁻¹ (combined) on disk/tape.
 - Ensures that if new physics is found (e.g. in LFV) that one can start to perform rudimentary measurements of such phenomena.
 - 10ab⁻¹ of data is sufficient to start to constrain models of LFV in τ decays.
 - Will be able to start measuring parameters in V_{SCKM} (if SUSY exists). Or constrain Multi TeV energy level NP.
 - Strong constraints on NP that complement the LHC direct searches!

How to get increased \mathcal{L}

$$\mathcal{L} = \frac{\gamma_{\pm}}{2er_e} \left(1 + \frac{\sigma_y^*}{\sigma_x^*} \right) \left(\frac{I_{\pm} \xi_{\pm y}}{\beta_y^*} \right) \left(\frac{R_L}{R_y} \right)$$

Lorentz factor,
classical e^{\pm} radius and
ratio of beam sizes

Beam current: I
beam-beam parameter: ξ
vertical β function at IP

Reduction factor from
crossing angle and the
hourglass effect

- Option 1: Brute Force.
 - Increase beam current.
 - Decrease β_y^* .
 - Increase beam-beam effect ξ (reduce bunch length).

(Hard – but possible – to do all of this efficiently)

How to get increased \mathcal{L}

$$L = \frac{\gamma_{\pm}}{2er_e} \left(1 + \frac{\sigma_y^*}{\sigma_x^*} \right) \left(\frac{I_{\pm} \xi_{\pm y}}{\beta_y^*} \right) \left(\frac{R_L}{R_y} \right)$$

Lorentz factor,
classical e^{\pm} radius and
ratio of beam sizes

Beam current: I
beam-beam parameter: ξ
vertical β function at IP

Reduction factor from
crossing angle and the
hourglass effect

- Option 2: Large Crossing Angle.

- Have a 15mrad crossing angle of beams.
- Focus beams at IP (small β^*).
- Retain longer bunch lengths.
- Rotate colliding bunches so no geometric loss at IP.

- Align the focussed parts of bunches that cross each other at the IP.
Call this “Crab Crossing/Waist”.

P. Raimondi's
Crab Waist
concept.

**Test at DAΦNE
next Fall !!!**

Large crossing angle, small x-size

1) Head-on,
Short bunches

Overlap region

(1) and (2) have same Luminosity, but (2) has longer bunches and smaller σ_x

2) Large crossing angle,
long bunches

With large crossing angle the x and z planes are swapped

Large Piwinski angle:

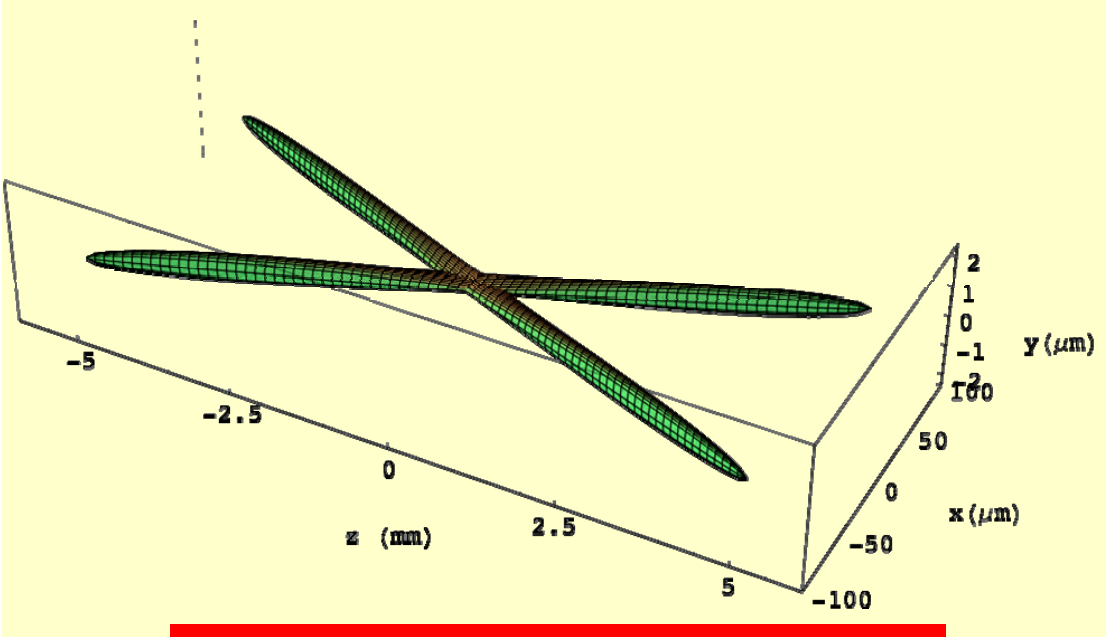

$$\Phi = \text{tg}(\theta)\sigma_z/\sigma_x$$

y waist can be moved along z with a sextupole on both sides of IP at proper phase

“Crab Waist”

IP beam distributions for KEKB

IP beam distributions for SuperB

An example...

	KEKB	SuperB
I (A)	1.7	2.
β_y^* (mm)	6	0.3
β_x^* (mm)	300	20
σ_y^* (μm)	3	0.035
σ_x^* (μm)	80	6
σ_z (mm)	6	5
L (cm⁻²s⁻¹)	1.7x10 ³⁴	1.x10 ³⁶

Here is Luminosity gain

Comparison between machines

	PEPII	KEKB	SuperB
current	2.5 A	1.7 A	2.3 A
β_y	10 mm	6 mm	0.3 mm
β_x	400 mm	300 mm	20 mm
ε_y (σ_y)	23 nm ($\sim 100\mu\text{m}$)	\sim the same ($\sim 80\mu\text{m}$)	1,6 nm ($\sim 6\mu\text{m}$)
γ/x coupling (σ_y)	0,5-1 % ($\sim 6\mu\text{m}$)	0.1 % ($\sim 3\mu\text{m}$)	0,25 % ($0,035\mu\text{m}$)
Bunch length	10 mm	6 mm	6 mm
Tau l/t	16/32 msec	\sim the same	16/32 msec
ζ_y	0.07	0.1	0.16
\mathcal{L}	$1.2 \cdot 10^{34}$	$1.7 \cdot 10^{34}$	$1 \cdot 10^{36}$

Detector Design

IPPP, October 2007

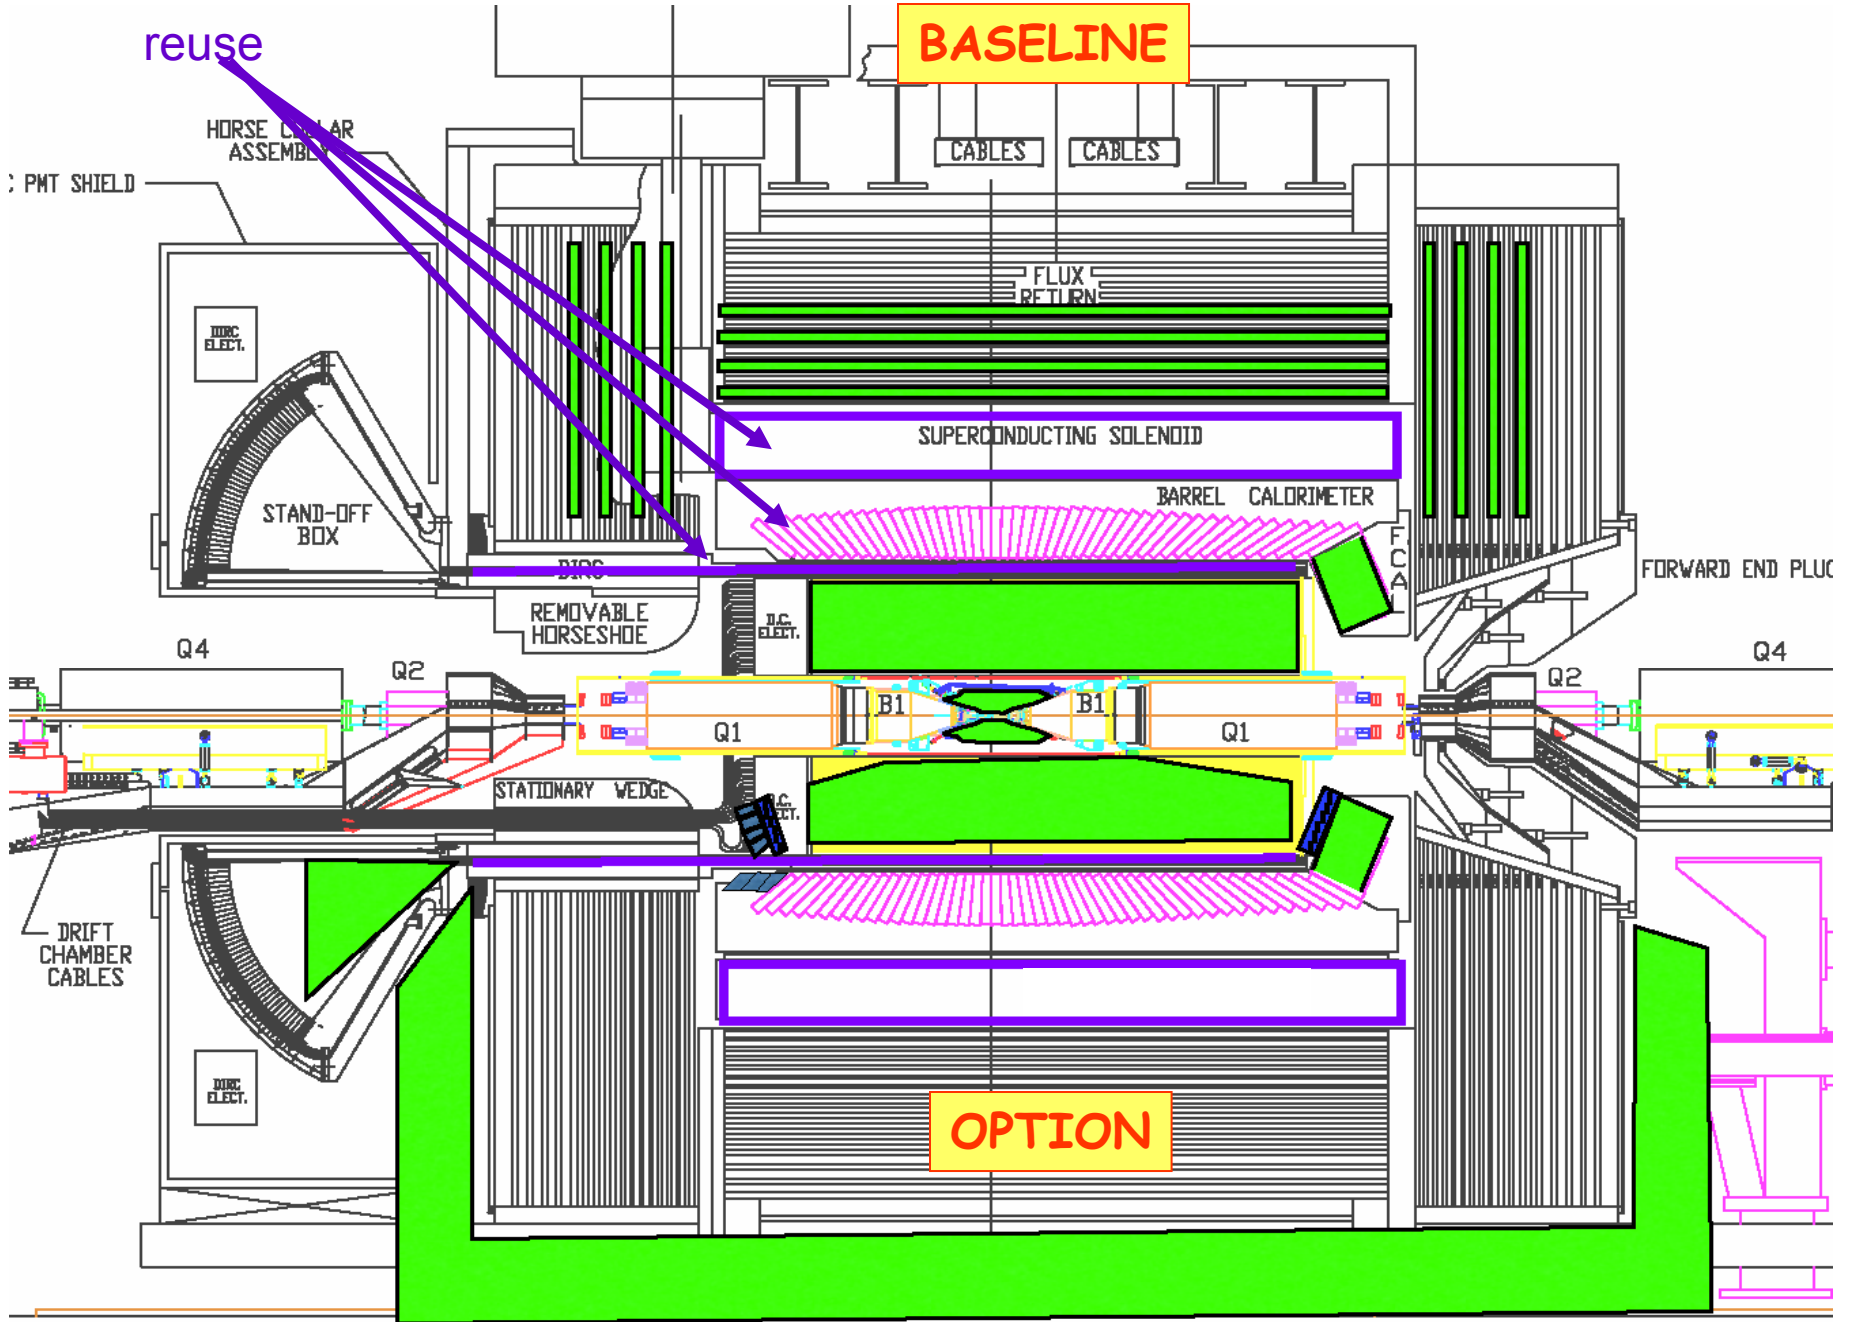

Adrian Bevan
<http://www.pi.infn.it/SuperB/>

Requirements

- The B-factory detectors work extremely well.
 - Design of a SuperB detector, essentially means a refinement of the existing detectors.
- SuperB environment will have a higher rate.
 - Some existing detector parts are reusable.
 - CsI Calorimeter barrel.
 - DIRC quartz bars from BaBar. These 3m long bars are required for the particle identification system.
 - Superconducting Solenoid Magnet: creates a 2T magnetic field.
 - Some existing detector parts need to be replaced to cope with the expected rates.
 - Central tracking inside the particle ID system.
 - End Cap of the calorimeter.
 - Instrumented Flux Return (μ , K^0_L detector).
 - Readout electronics.
 - Makes sense to optimise reuse in order to limit the cost of the project.

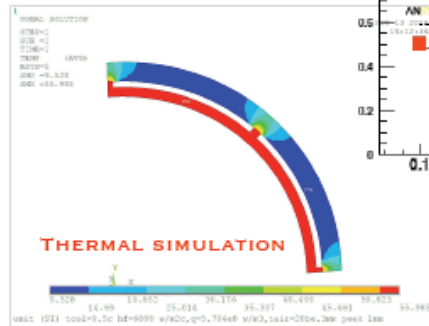

Tracking

SILICON VERTEX TRACKER

- BaBar DCH Design
- Adequate performance.
 - Needs to be replaced as the existing detector is aging.

- Baseline: use an SVT similar to the Babar one, complemented by one or two inner layers.
- Cannot reuse because of radiation damage
- Beam pipe radius is of paramount importance
 - inner radius: 1.0cm,
 - layer0 radius: 1.2cm,
 - thickness: $0.5\% X_0$

HADRON 07: FRASCATI, 12 OCT

EUGENIO PAOLONI

Slide taken from a talk by E. Paoloni @ Hadron 07

IPPP, October 2007

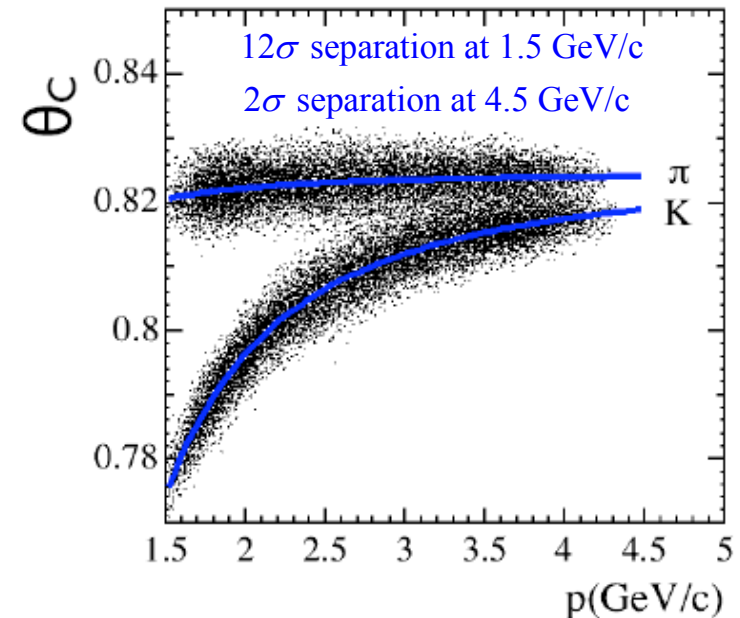

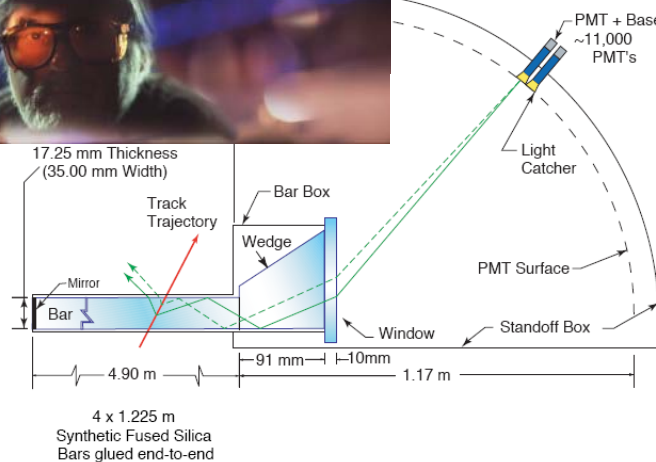

Adrian Bevan
<http://www.pi.infn.it/SuperB/>

42

Particle ID

- Detector of Internally Reflected Cherenkov light (DIRC) works extremely well.
- Aim to reuse this principle with state of the art readout.

Can benefit from reducing the volume of water between the end of the quartz bars and the photodetectors (PMTs) at SuperB.

Calorimeter Barrel

- Calorimeter Barrel is more than sufficient for our needs.

- Fast enough signal output for the expected rates at SuperB
- Not suffering from any signs of radiation damage, having been used in BaBar since 1999.

Calorimeter End-Cap

- BaBar End-Cap doesn't have a fine enough granularity for rates at SuperB.
 - Need a finer segmentation.
 - Similar total X_0 .
 - Faster readout electronics.
 - Several candidate materials for End-Cap replacement.
 - LYSO is baseline
 - expensive at the moment (~\$40/cc).
 - Aim for \$15/cc.
 - Need to integrate into the existing Barrel, and optimise segmentation.
 - R&D underway toward a LYSO Calorimeter test-beam in ~2009.

2.5 x 2.5 x 20 cm (18 X_0) Bar

Instrumented Flux Return

- BaBar has 5 radiation lengths of material for μ identification in the flux return.
 - This is not optimal.
 - SuperB will have more iron.
- The segmentation of active regions of the flux return will remain the same as BaBar (3.7cm pitch).
- 7-8 layers of MINOS style scintillator bars.

MINOS PRODUCTION BARS SHOWING 4 x 1 cm² CROSS SECTION WITH CO-EXTRUDED TiO₂ AND GROOVE FOR WLS FIBER

ATTENUATION LENGTH MEASUREMENTS FOR 5 CASES

DAQ

- Modelled on the BaBar Data Acquisition system.

As is the norm with modern experiments, will need tens-hundreds of Pb storage for SuperB.

Cumulative Storage (Pb)	3.9	17.5	47.0	83.4	121.4
Parameter	Year 1	Year 2	Year 3	Year 4	Year 5
Luminosity (ab^{-1})	2	6	12	12	12
Storage (PB)					
Tape	3.1	10.2	22.0	26.2	27.8
Disk	0.83	3.35	7.55	10.2	10.2
CPU (MSpecInt2000)					
Data reconstruction	3.0	8.8	14.7	8.8	0.0
Skimming	2.7	9.4	16.1	12.1	0.0
Monte Carlo	9.5	28.0	46.6	28.0	0.0
Physics analysis	5.1	15.0	30.0	30.0	30.0
Total	20	61	107	79	30

First Year Requirements

Subsequent year increments

Timescale

- Overall schedule dominated by:
 - Site construction.
 - PEP-II/Babar disassembly, transport, and reassembly.
- Possible to reach the commissioning phase after 5 years from T0.
- Physics from circa 2015?

Figure 5-1. Overall schedule for the construction of the SuperB project.

1.9	Installation and integration	353	624	3830	0
1.A	Project Management	720	0	180	0

Note: options in italics are not summed. We chose to sum the options we considered most likely/necessary.

Total = 338M Euro.

= 510M Euro (counting the cost of re-used parts).

⇒ 1/3 of the cost of the project can be saved by re-using parts of BaBar and PEP-II.

Next Steps...

- SuperB Conceptual Design Report compiled (Winter 06/07).
 - Proposed site is the Tor Vergata Campus, Frascati, Italy.
- CDR under INFN funding review by an international committee chaired by John Dainton.
 - Meet with committee on 12/13th November at Frascati.
 - Committee will report back to INFN in the 1st quarter of 2008.
- If positive, will discuss the project with ECFA and CERN strategy group.
 - Collaboration will form O(1 year).
 - R&D will continue for O(2 years).
 - Technical Design Reports finalised O(2 years).
 - Construction T0 = O(2 years).

Summary

IPPP, October 2007

Adrian Bevan
<http://www.pi.infn.it/SuperB/>

52

Conclusion

- The SuperB programme has a rich physics case.
 - Much more than I've had time to cover in this seminar!
 - See the 'Physics' section of the SuperB CDR for details.
- Rare decay searches in the worlds largest samples of B, D, τ particles.
 - N.B. the chapter on charm was written before D^0 - \bar{D}^0 oscillations were discovered. The reach for CPV searches in charm needs to be studied!
- Probe:
 - flavour structure of new physics found at the LHC.
 - $\geq O(\text{TeV})$ indirect NP search capability using rare decays.
- Many important measurements unique to SuperB.
- Complementarity with the LHC high energy frontier and flavour programmes.
 - Need a SuperB to start understanding the flavour coupling of NP in the LHC era.

Super B factory and Super LHCb:

Sensitivity Comparison ~2020

LHCb 100 fb⁻¹ vs Super-B factory 50 ab⁻¹

SuperB numbers from M Hazumi - Flavour in LHC era workshop;
 LHCb numbers from Muheim
 --- = numbers from Ristori

CDF an important player

- $B_s \rightarrow \mu \mu$
 - $\sim 1-2 \cdot 10^{-8}$ con 6 fb⁻¹
- $\Delta\Gamma_s$ e ϕ_s da $B_s \rightarrow J/\psi \phi$
 - $\sigma(\Delta\Gamma_s) 0.04$ con 6 fb⁻¹ (2 σ)
- CP Asymmetry in $B_s \rightarrow K \pi$
 - 6% con 6 fb⁻¹ (6 σ)
- CP Asymmetry in $B_d \rightarrow K \pi$
 - 1% con 6 fb⁻¹
- World best lifetimes
 - $B_s, \Lambda_b, B_c, \Sigma_b$, new states... ???
- D^0 mixing
 - migliore misura di frequenza?
 - sensibile ad ACP

D0 mixing

- Recent measurements from Babar and Belle demonstrated Bfactory capabilities in charm physics
- Possibility to measure CP violation in the charm sector

Updated Limit Plots: PDG07

Paris, May 9, 2007

5th SuperB Workshop
