- The Higgs Boson
- Beyond the Standard Model

Over 100 years of discovery and experimentation

Discovery of electron - Thompson 1897

Birth of quantum physics - Planck 1900

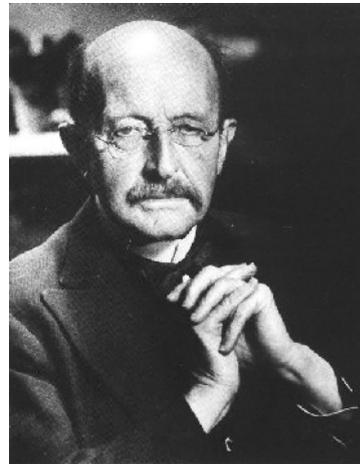

Relativity - Einstein 1905

Atomic structure - Rutherford 1911

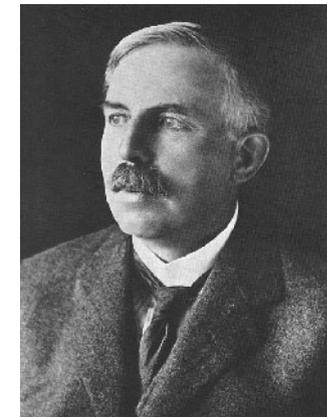

...and much more!

Thompson

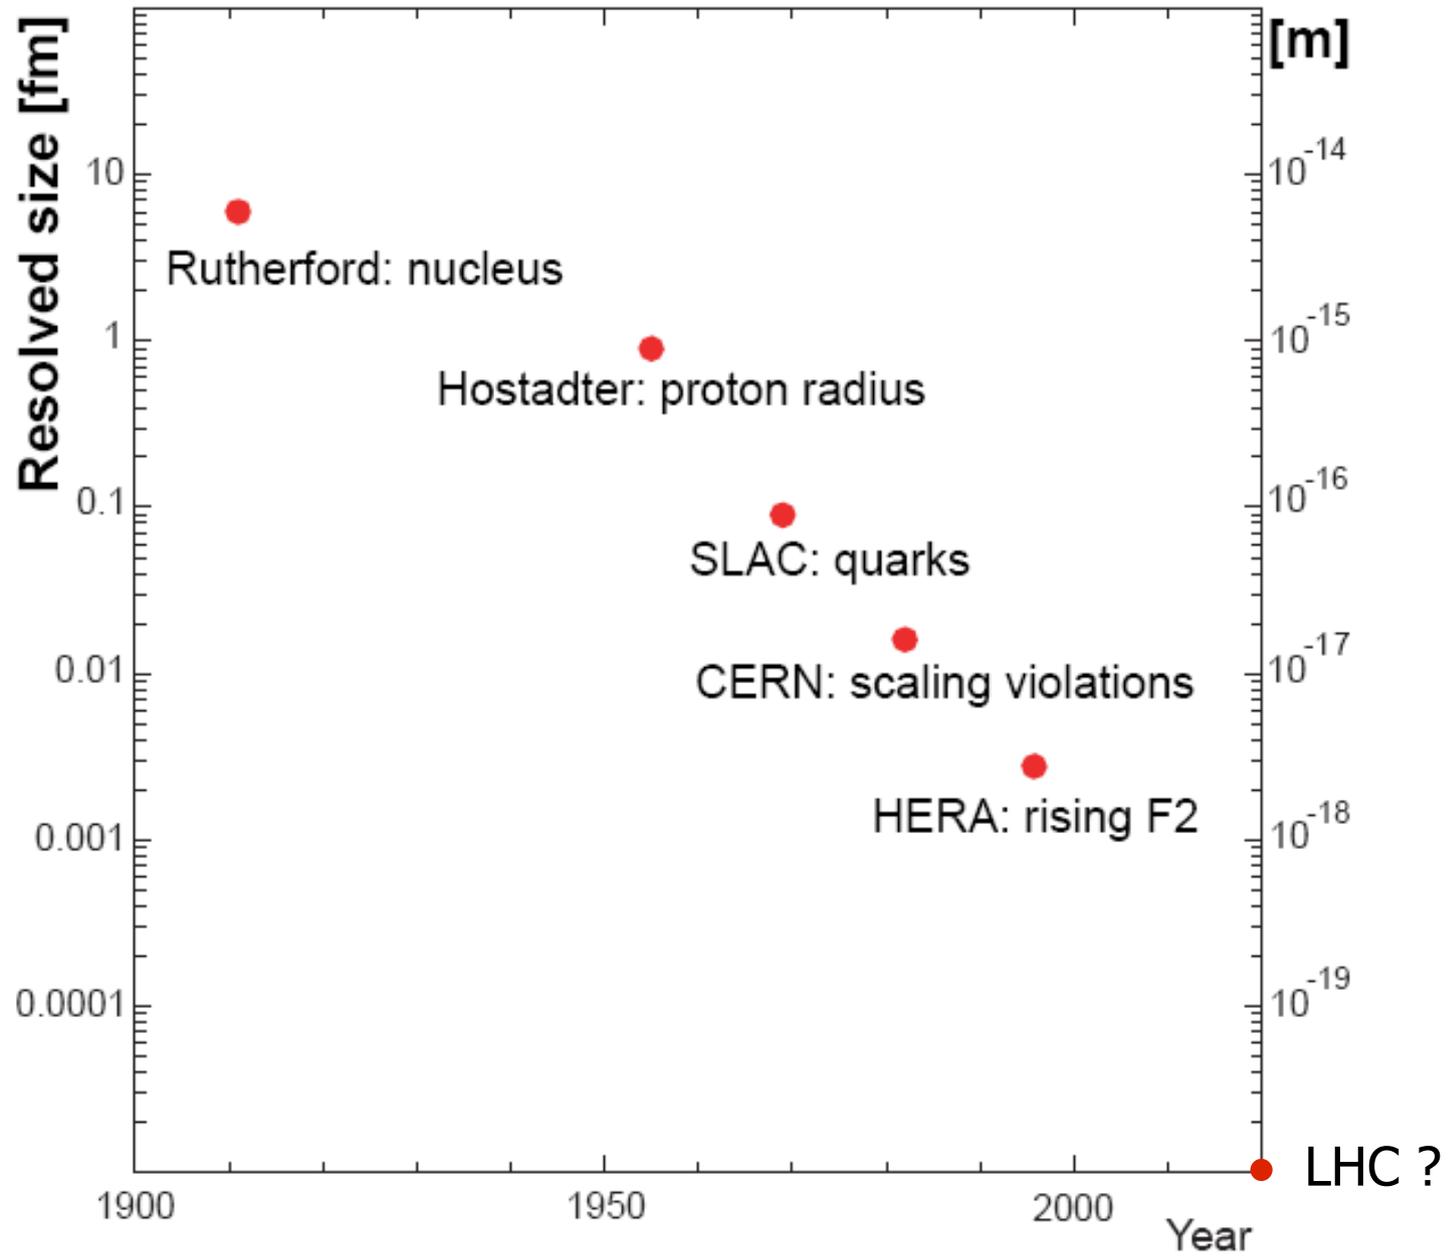

Planck

Rutherford

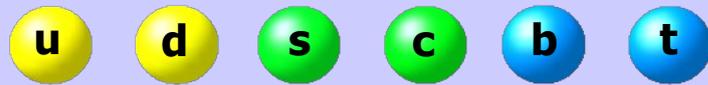

... what have we learnt ?

# The Standard Model

Worlds most successful theory to date - Describes fundamental constituents of matter

quarks: strong, weak, electromagnetic

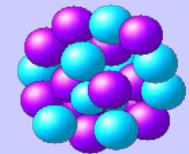

charged leptons: weak, electromagnetic

neutrinos: weak

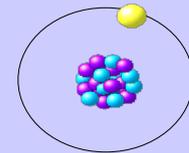

gluons 

Strong: holds atomic nucleus together

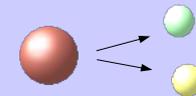

photons 

Electromagnetic: binds atom together

W and Z bosons 

Weak: radioactive decay processes

No description of Gravity at sub-atomic level

Electromagnetic & Weak parts of Standard Model are known extremely precisely

Theory of strong interactions is less well known

Based on perturbation theory & relativistic quantum mechanics  
 given us the language of Feynman diagrams to calc cross sections

$$\text{Potential} = V + V'$$

$V$  gives rise to stationary stable, time independent states

$V'$  is a weak additional potential leading to transitions between states  $\psi_i \rightarrow \psi_f$

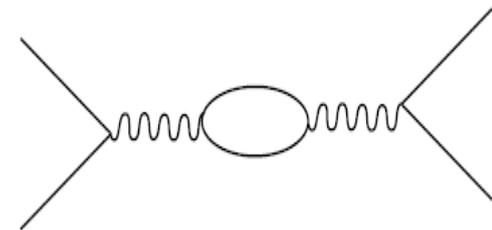

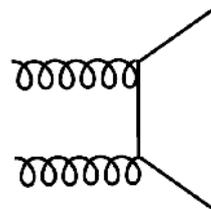

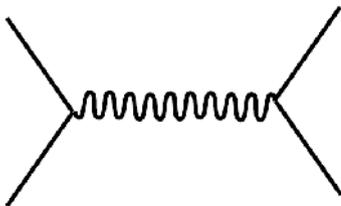

$$\sigma = \frac{2\pi}{\hbar} |V'_{fi}|^2 \rho(E_f)$$

$\rho(E_f)$  density of final states  
 and flux factors

$V'_{fi} = \int \psi_f^* V_{fi} \psi_i dv$  is known as the matrix element for the scattering process

$V'$  contains the standard model Lagrangian describes the dynamics of all interactions

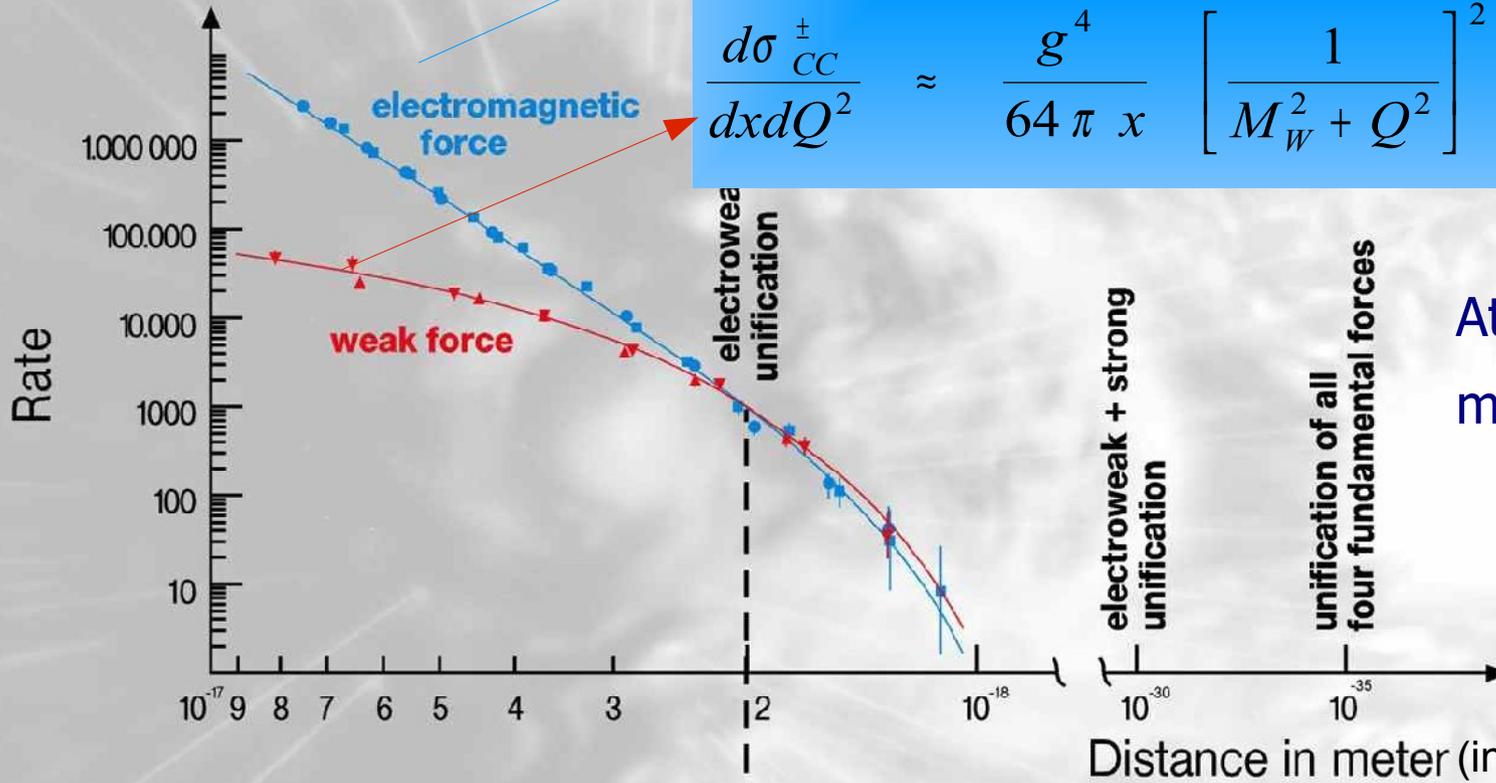

Series expansion in powers of couplings  $\alpha$  between particles for each force

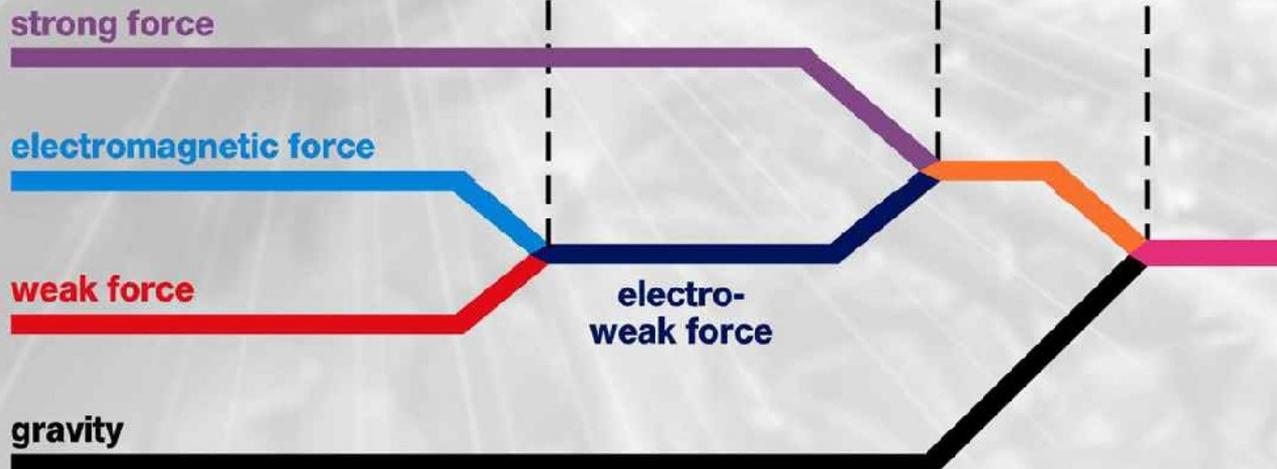

# Electro-Weak Unification

$$\frac{d\sigma_{NC}^{\pm}}{dx dQ^2} \approx \frac{e^4}{8\pi x} \left[ \frac{1}{Q^2} \right]^2 [Y_+ \tilde{F}_2 \mp Y_- x \tilde{F}_3]$$

$$\frac{d\sigma_{CC}^{\pm}}{dx dQ^2} \approx \frac{g^4}{64\pi x} \left[ \frac{1}{M_W^2 + Q^2} \right]^2 [Y_+ \tilde{W}_2^{\pm} \mp Y_- x \tilde{W}_3^{\pm}]$$

At high energy:  
masses are small  
→ forces are equal

Aim to unify all forces

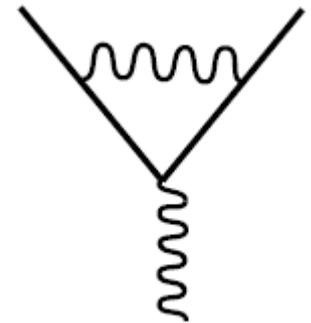

Quantum mechanics predicts the gyromagnetic ratio of the electron  $g=2$   
(ratio of magnetic dipole moment to it's spin)

Experiment measures  $g_{\text{exp}} = 2.0023193043738 \pm 0.00000000000082$

Discrepancy of  $g-2$  due to radiative corrections

Electron emits and reabsorbs additional photons

Corresponds to higher terms in perturbative series expansion

$$\frac{g_{\text{theory}} - 2}{2} = 1159652140(28) \times 10^{-12}$$

$$\frac{g_{\text{exp}} - 2}{2} = 1159652186.9(4.1) \times 10^{-12}$$

Phenomenal agreement between theory and experiment! 4 parts in  $10^8$

QED (quantum electrodynamics) is humanity's most successful theory

Demonstrates understanding of our universe to unprecedented precision

Equivalent to measuring distance from me to centre of moon

and asking if we should measure from top of head or my waist!

... but all is not well ...

## The complete Standard Model Lagrangian

$$\begin{aligned}

 \end{aligned}$$

## 22 Parameters of the SM to be measured

6 quark masses

3 charged leptons masses (better than 105 params of generic SUSY)

3 coupling constants

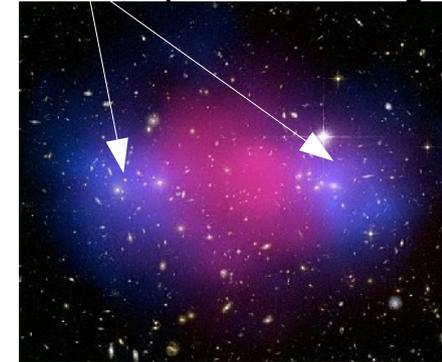

4 quark mixing parameters

4 neutrino mixing parameters

1 weak boson mass (1 predicted from other EW params)

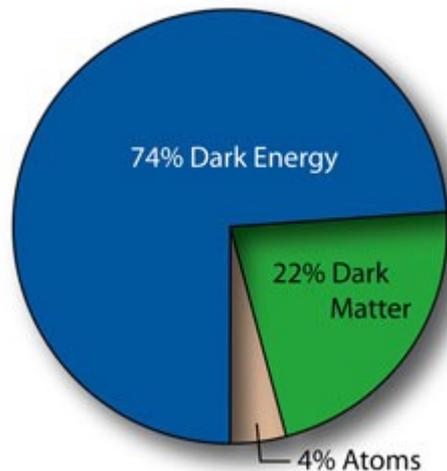

1 Higgs mass

Two gas clouds collide  
Clouds slow down  
Dark matter passes through

We have no idea what 96% of the universe is!

- unknown form of dark energy
- unknown form of dark matter

No treatment of gravity in the Standard Model...  
In a symmetric theory gauge bosons are massless  
Higgs mechanism explains EW symmetry breaking  
→ EW bosons acquire mass

...but there must be a deeper relationship  
between Higgs / mass / gravity / dark energy

Why is gravity  $\sim 10^{33}$  weaker than EW interactions?

Why is Higgs mass ( $\sim 100$  GeV) so much smaller than Planck mass ( $10^{19}$  GeV)?

Leads to fine tuning problem

self energy corrections to Higgs mass are quadratically divergent upto  $10^{19}$  GeV

physical mass = bare mass + "loops"  $m_H^2 = m_0^2 + \Delta m_H^2$

since Higgs is scalar field we get:

for top:  $\Delta m_H^2 = -\frac{6}{16\pi^2} g_t^2 \Lambda^2$  (g is Yukawa coupling  $\propto$  mass)

for EW bosons:  $\Delta m_H^2 = +\frac{1}{16\pi^2} g^2 \Lambda^2$

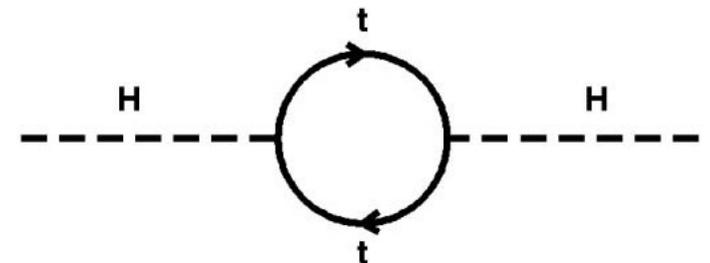

for Higgs:  $\Delta m_H^2 = +\frac{1}{16\pi^2} \lambda^2 \Lambda^2$  ( $\lambda$  is Higgs self coupling)

$m_H^2 = m_0^2 + \frac{1}{16\pi^2} (-6g_t^2 + g^2 + \lambda^2) \Lambda^2 - \dots$  new physics...

For  $\Lambda^2 : (10^{19} \text{ GeV})^2$  and  $m_H : (100 \text{ GeV})^2$  then

$m_H^2 = m_0^2 + \frac{1}{16\pi^2} (-6g_t^2 + g^2 + \lambda^2) \cdot 10^{38} \approx (100 \text{ GeV})^2$

- if SM is valid to this scale (i.e. no new physics from 1 TeV -  $10^{19}$  GeV) incredible fine tuning required between bare mass and the corrections to maintain  $\sim 100$  GeV Higgs mass

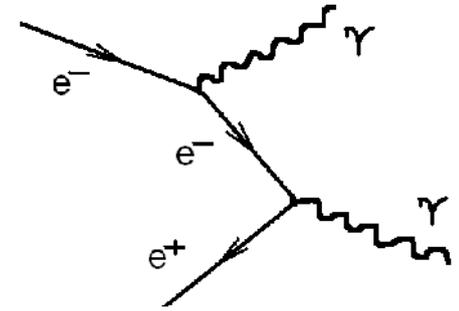

Standard Model is lacking:

why 3 generations of particles?

why do particles have the masses they do?

no consideration of gravity on quantum level...

In the Standard Model matter and anti-matter produced in equal quantities

In the Big Bang: for every quark, one anti-quark is also produced

As universe cools expect all particles and anti-particles to annihilate

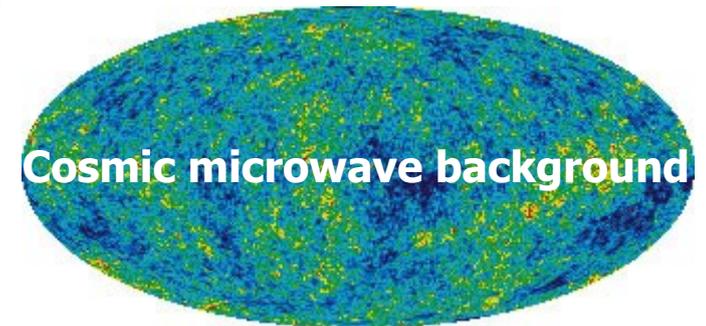

⇒ soon after big bang all matter will have annihilated to photons

We should not exist!

For every proton/neutron/electron in universe there are  $10^9$  photons (CMB)

Thus matter/anti-matter asymmetry must be  $1:10^9$

We cannot see where this asymmetry lies...

(Actually SM can account for only  $1000^{\text{th}}$  of this asymmetry)

What are the current collider experiments doing?

Neutrinos only interact via weak force  $\Rightarrow$  very inert  
 involved in weak beta decays powering solar fusion  
 Solar neutrino flux is large  $\sim 10^6$  through your thumbnail every second!

Neutrinos exhibit quantum mechanical property of flavour oscillation  
 neutrinos are produced with definite flavour but propagate with definite mass  
 flavours oscillate during propagation  
 sensitive to neutrino masses (small, but currently unknown)

Simple case of two neutrino flavours:

$$\begin{pmatrix} \nu_e \\ \nu_\mu \end{pmatrix} = \begin{pmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{pmatrix} \begin{pmatrix} \nu_1 \\ \nu_2 \end{pmatrix}$$

$$P(\nu_\mu \rightarrow \nu_e) = \sin^2(2\theta) \cdot \sin^2\left(1.27 \cdot \Delta m^2 \cdot \frac{L}{E}\right)$$

$$\Delta m^2 = |m_1^2 - m_2^2|$$

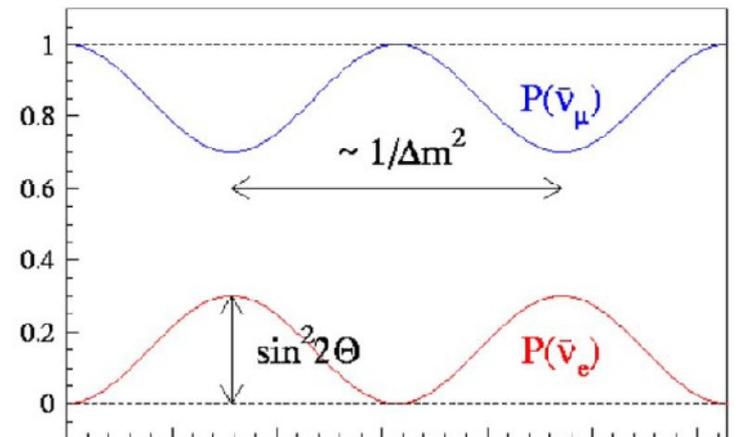

$L$  = distance

$E$  = neutrino energy

T2K will measure oscillation parameters

flavour eigenstates      mass eigenstates

Probability

# The T2K Experiment

Full 3x3 representation

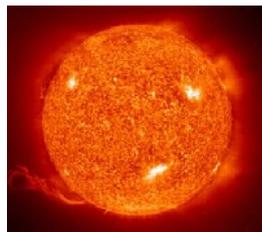

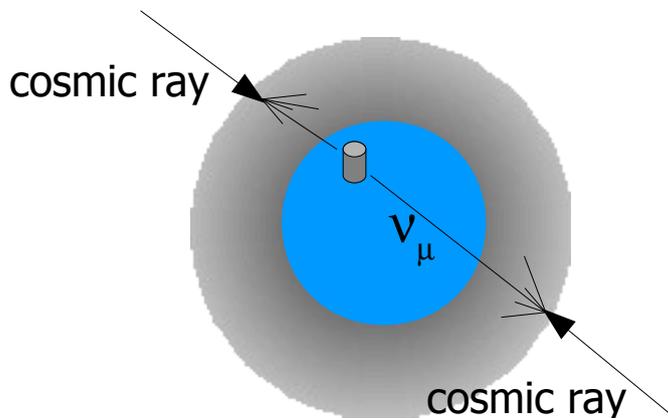

states of definite flavour

$$\begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \end{pmatrix} = \begin{pmatrix} c_{12} & s_{12} & 0 \\ -s_{12} & c_{12} & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \cos\theta_{13} & 0 & \sin\theta_{13} \\ 0 & 1 & 0 \\ -s_{13} & 0 & c_{13} \end{pmatrix} \begin{pmatrix} \sin\theta_{13} \\ \cos\theta_{13} \\ 0 \end{pmatrix} \begin{pmatrix} 1 & 0 & 0 \\ 0 & c_{23} & s_{23} \\ 0 & -s_{23} & c_{23} \end{pmatrix} \begin{pmatrix} \delta \neq 0 \\ \Rightarrow \text{CP violation!} \end{pmatrix} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & e^{i\delta} \end{pmatrix} \begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \end{pmatrix}$$

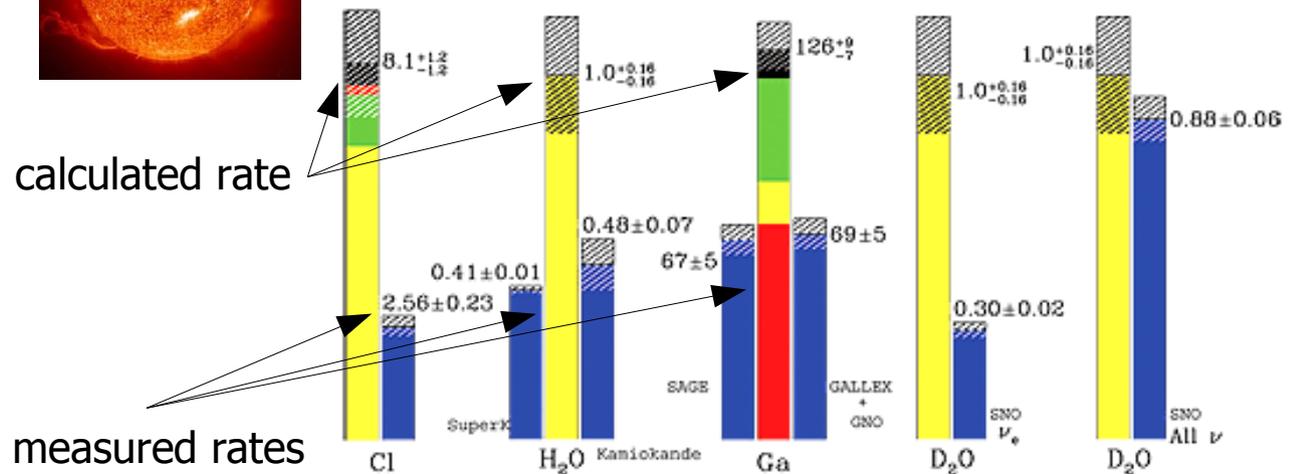

states of definite mass

So far experiments measured solar and atmospheric neutrino anomalies

Measure  $\nu_\mu$  from down-coming and up-going neutrinos produced in atmosphere

Sun produces calculable rate of  $\nu_e$   
measure  $\sim 30\%$  less than expected

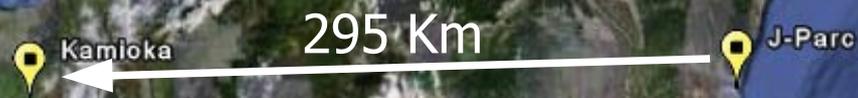

Experiments sensitive to different neutrino flavours

sensitive to all flavours!

T2K will measure neutrino properties:

- measure neutrino oscillations
- sensitive to neutrino masses
- sensitive to neutrino matter/anti-matter asymmetry

Measure appearance rate of  $\nu_e$

50 GeV proton beam  
0.75 MW peak power  
produce  $\nu_\mu$  beam

Search for  $0\nu\beta\beta$  decay of  $^{150}\text{Nd}$  dissolved in scintillator (endpoint 3.3MeV)

The Simulated Spectrum of Double Beta Decay Events

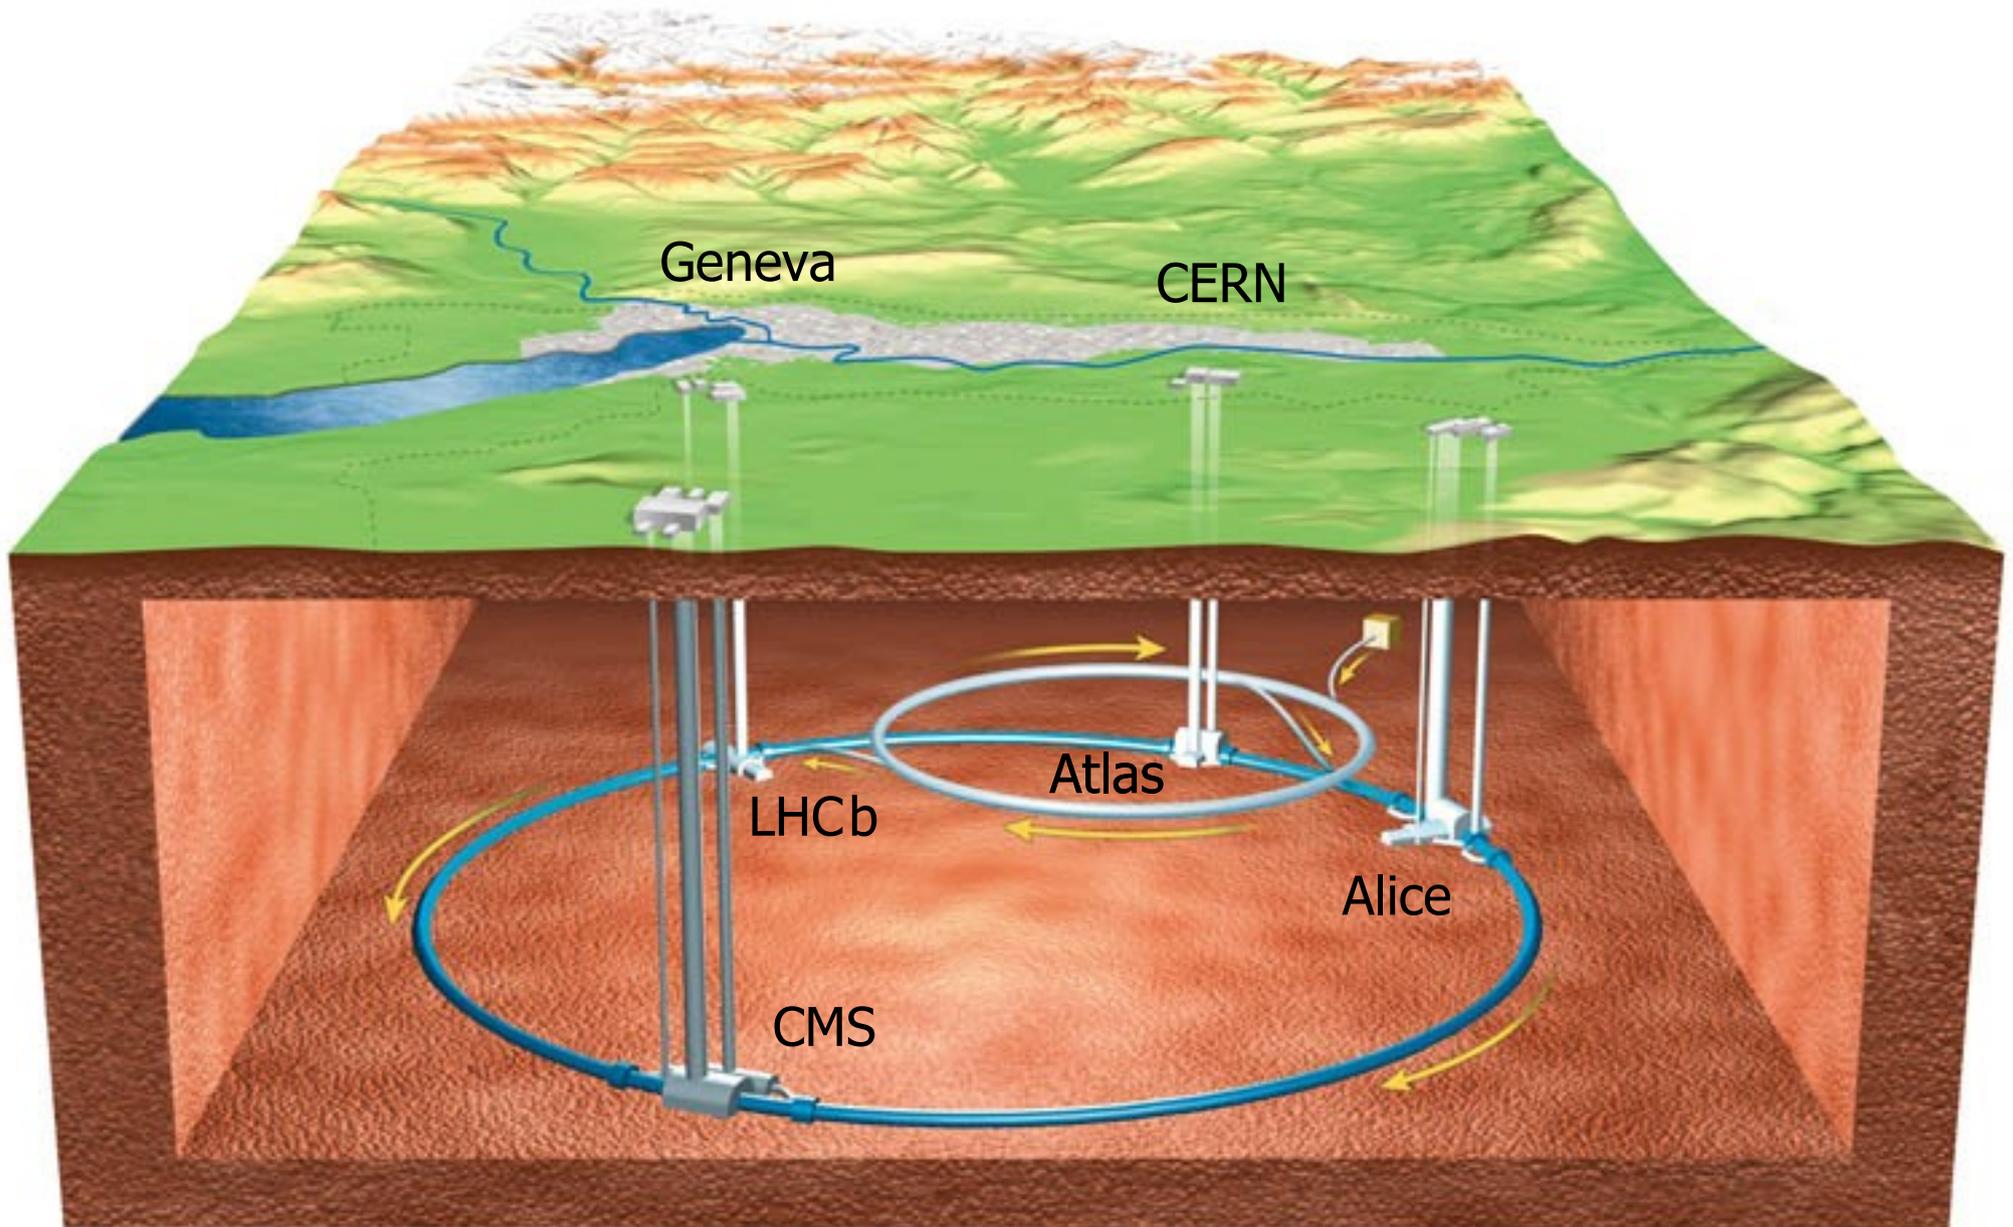

# The Large Hadron Collider

Particle Physics is a global enterprise: experiments in all continents (incl. antarctica!)

# The Large Hadron Collider

LHC will collide protons at 7 TeV (7000 GeV)

27 km circumference ring

1200 superconducting dipole magnets  $\sim$  9 T field

3000 tons of magnets supercooled to 1.9K

Each beam has energy equivalent to 100 kph Eurostar train

Proton bunches collide in bunches every 25 ns

Beams have transverse size  $\sim$ 15  $\mu\text{m}$  ( human hair  $\sim$ 20  $\mu\text{m}$  )

20 interactions every bunch crossing

Particles from one collision still travelling when next collision occurs!

One of the largest scientific / technological projects ever undertaken

>  $100 \times 10^6$  electronic channels

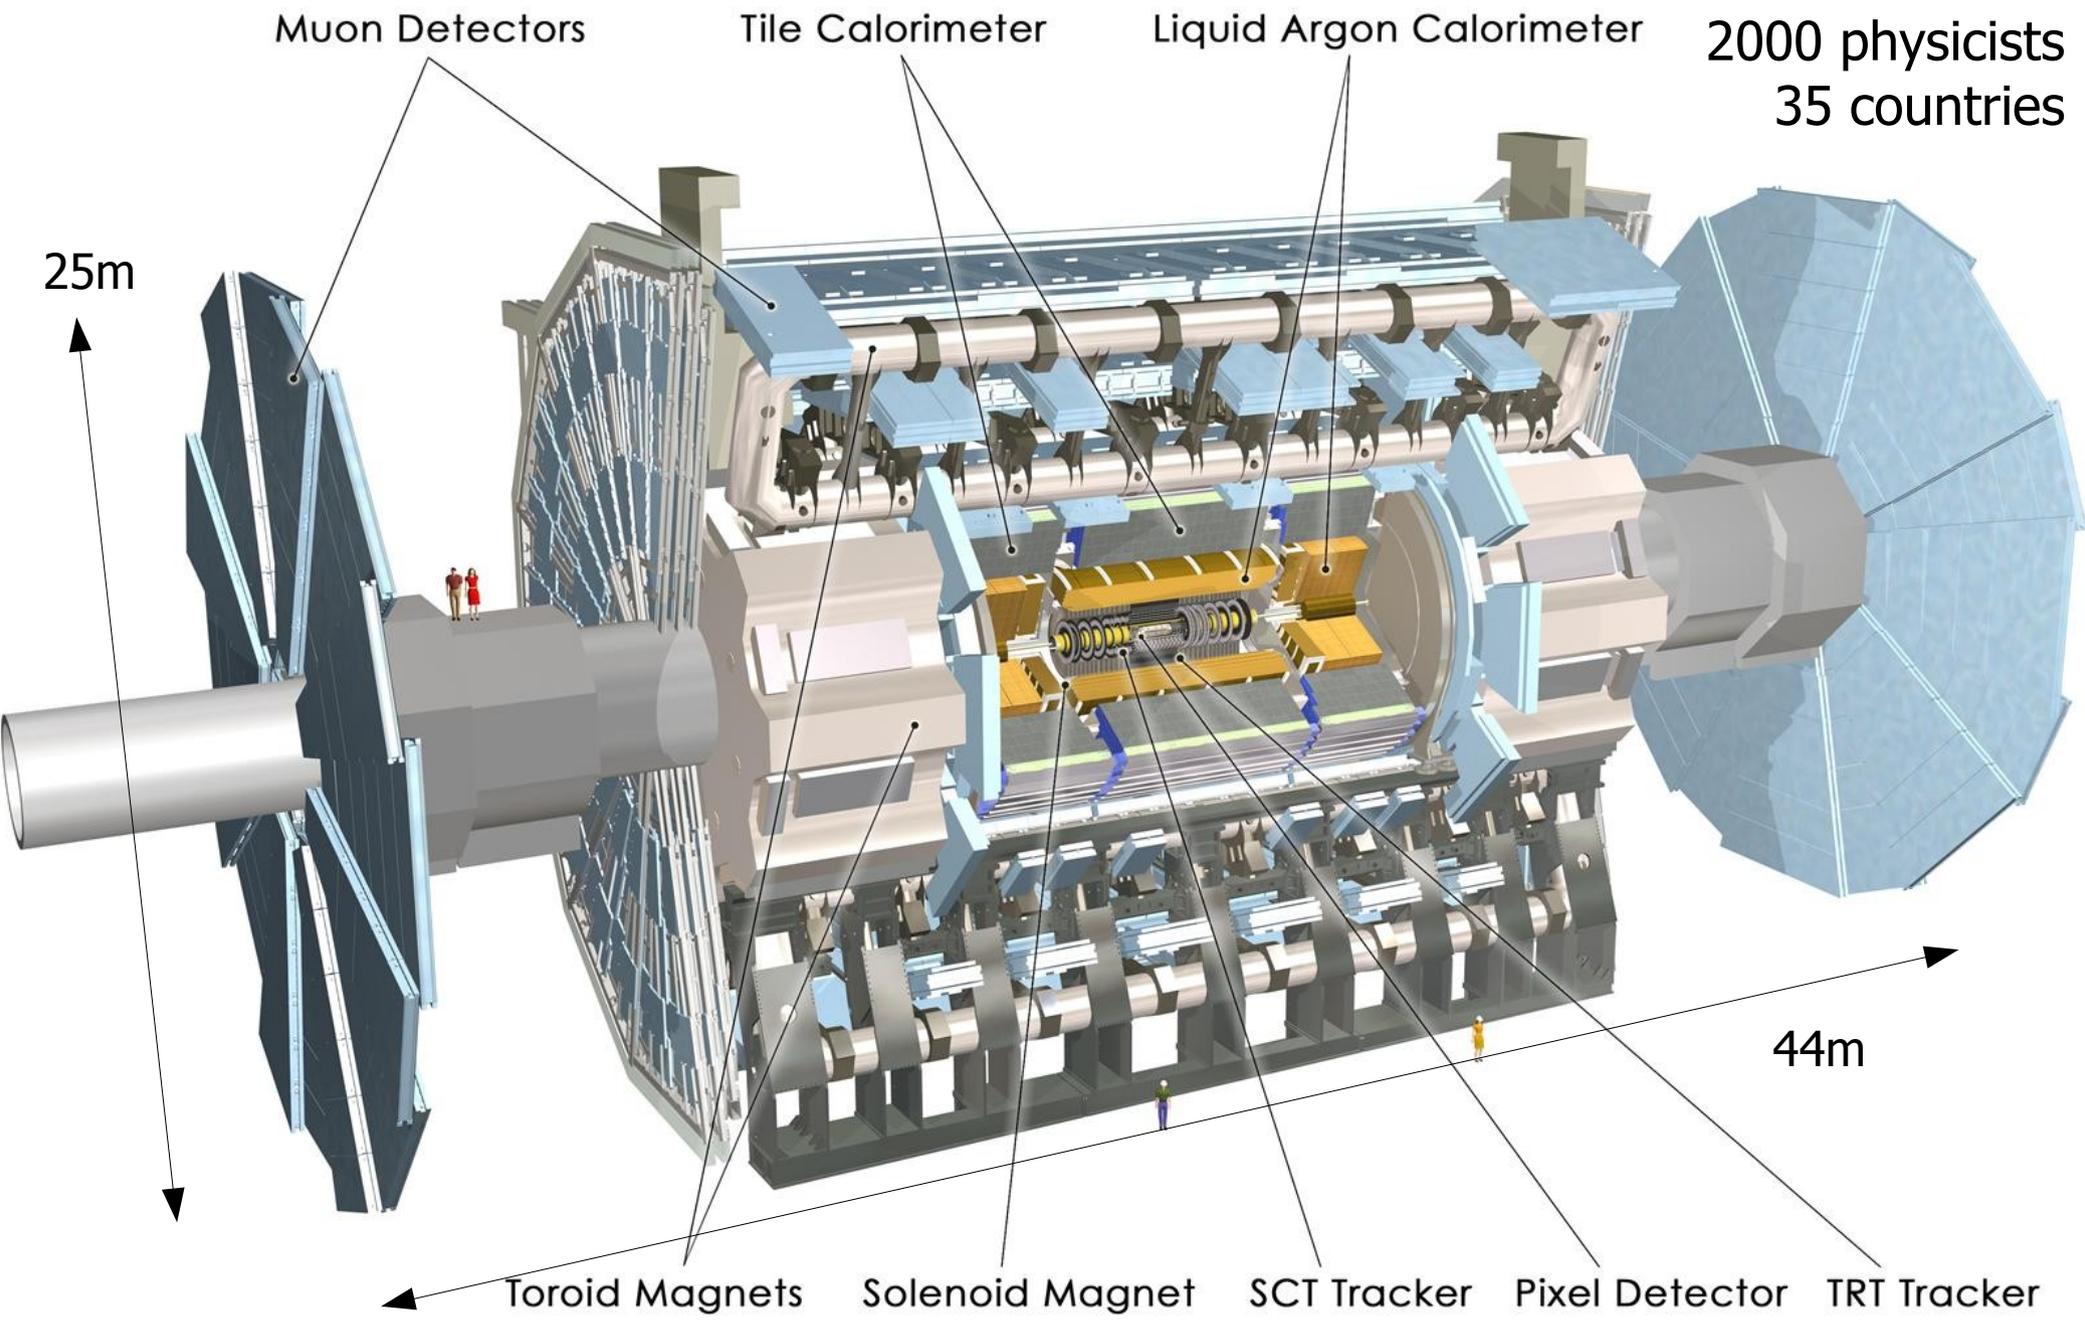

$\sim 10^9$  proton-proton interactions per second

$\sim 1$  Higgs  $\rightarrow \gamma\gamma$  per hour

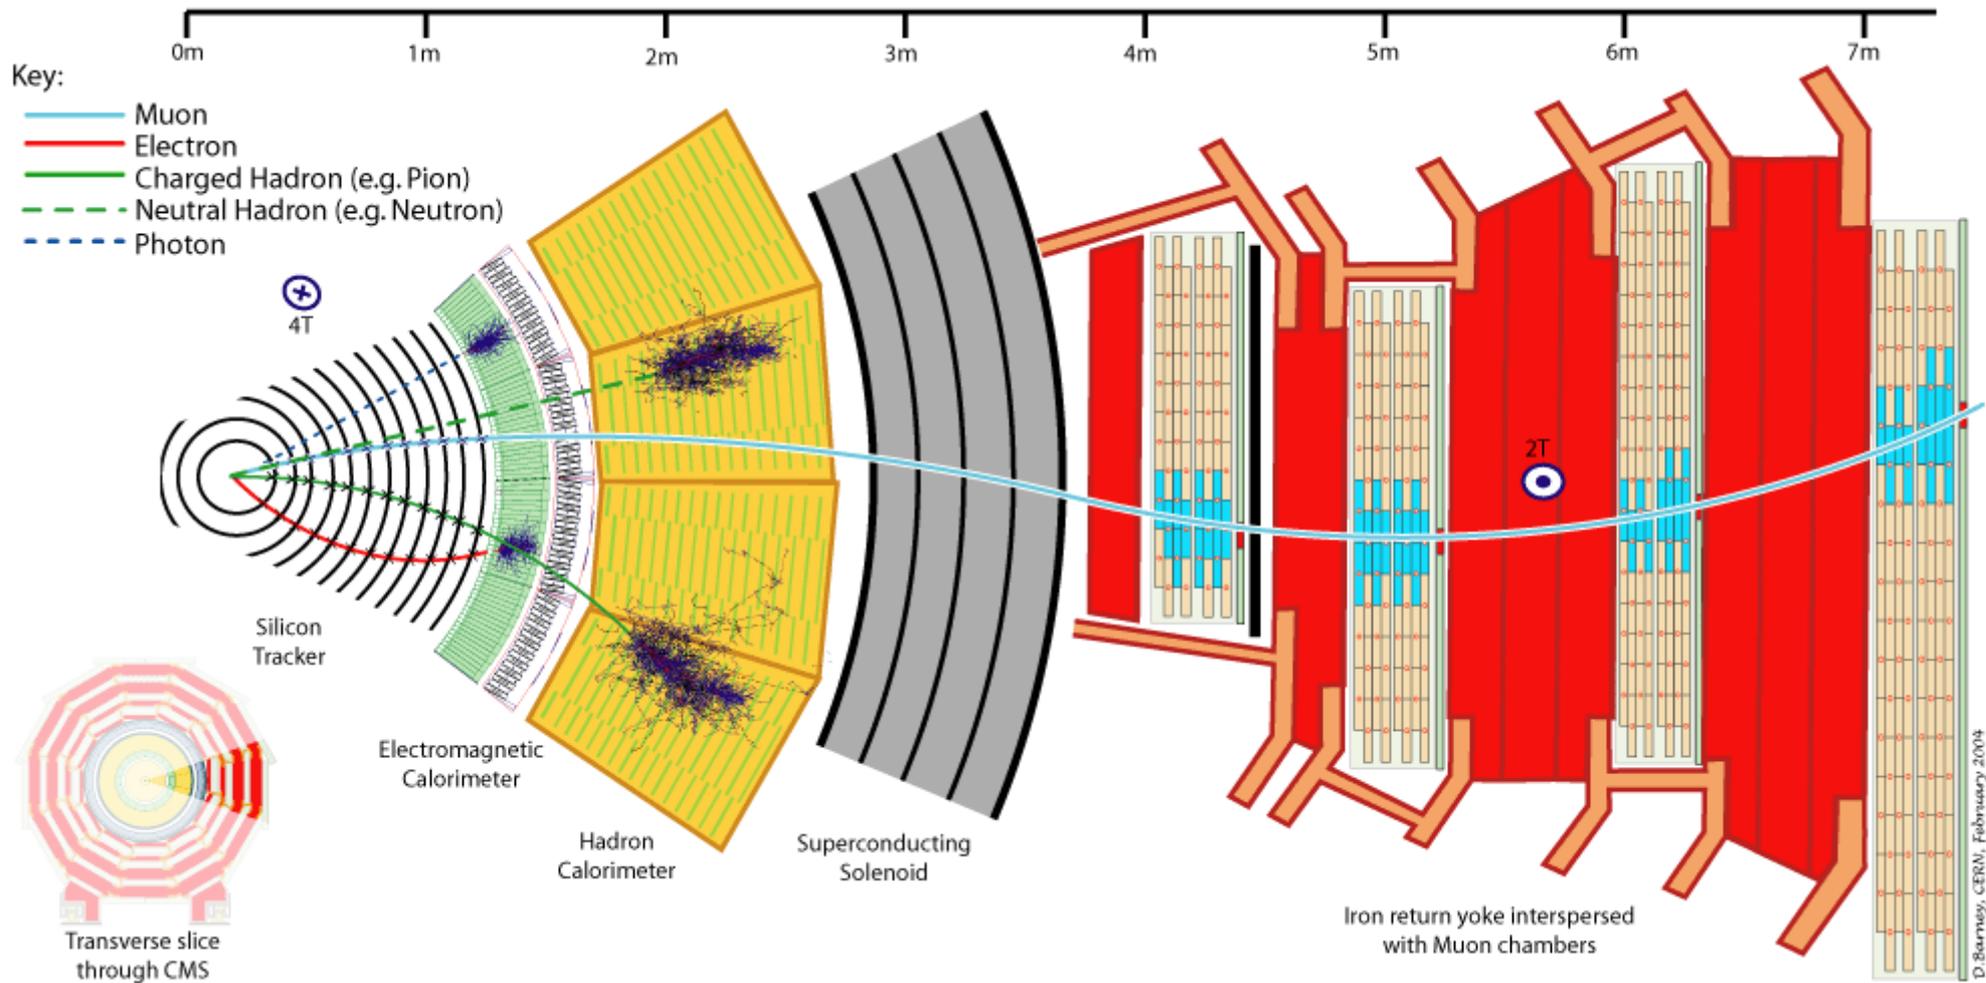

10 x  $10^6$  Gigabytes of data per year  
(equivalent to 1/2 million HD movies per year)

# The Atlas Experiment

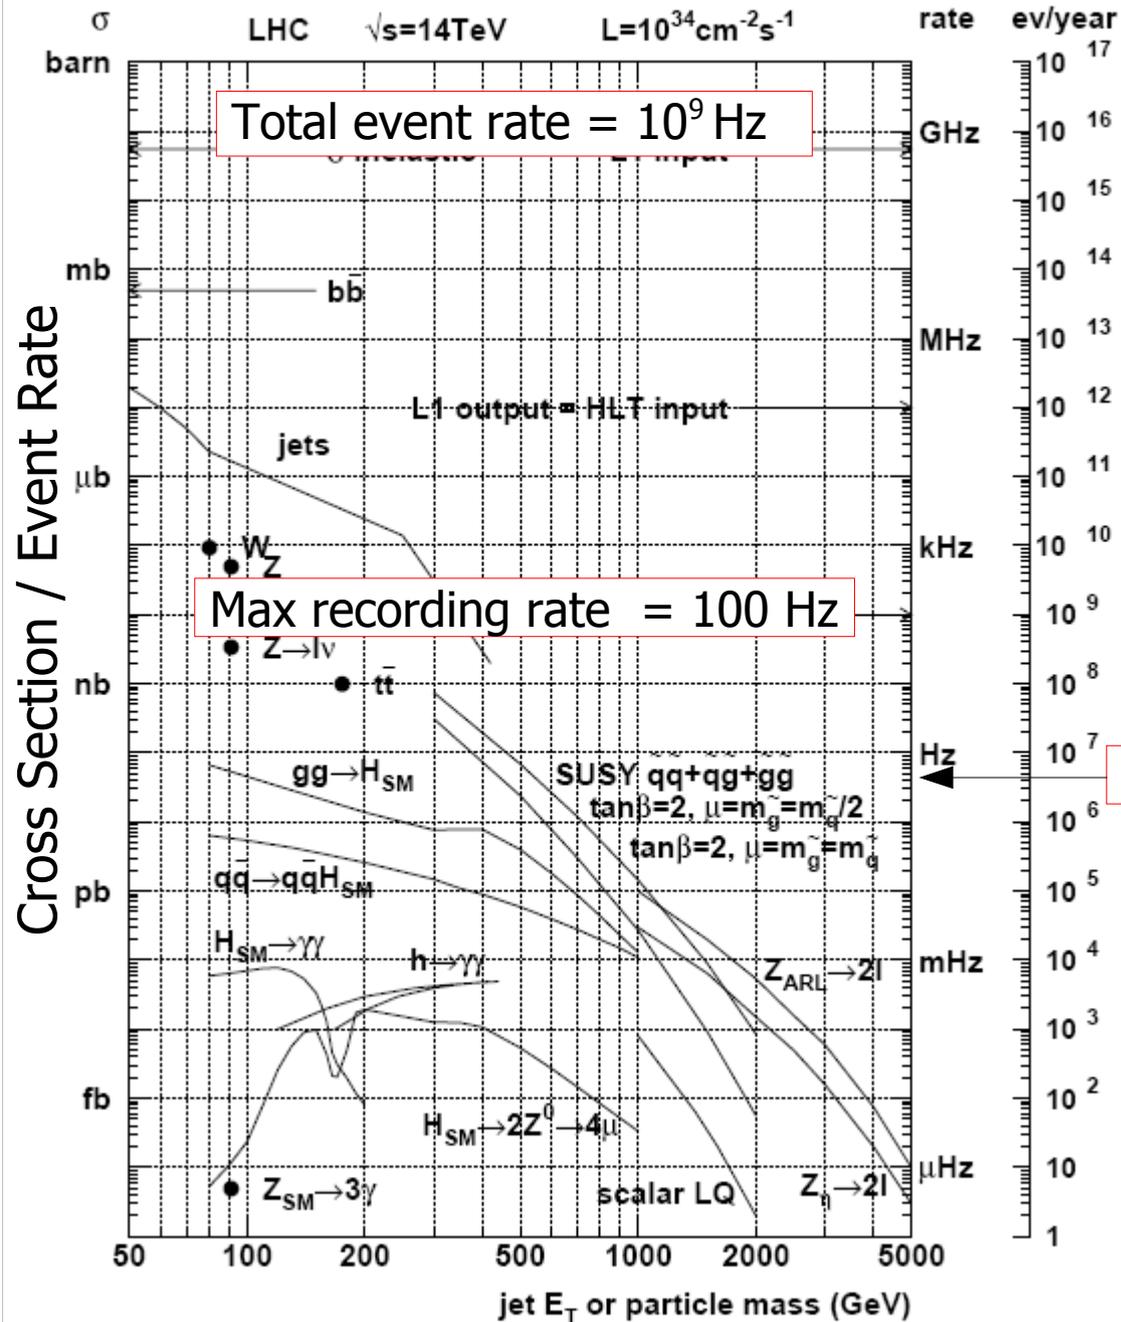

# The CMS Experiment

3600 physicists  
38 countries

# The Large Hadron Collider

Huge event rates

New physics swamped!

Need to filter events  $1:10^7$  online

Like trying to find a cheap plumber from entire human population in  $2 \mu\text{s}$

Rate of 100 GeV Higgs production

What are we looking for?

Almost all the visible mass of universe is due to massless QCD effects  
Energy associated with quark and gluon interactions  $\rightarrow$  proton & neutron mass

Higgs particle postulated to explain masses of **fundamental** particles

Gauge theory predicts force carrier particles to be massless e.g. photon & gluon  
But  $W^\pm$  &  $Z^0$  boson have large masses  $\sim 80$ - $90$  GeV (proton  $\sim 1$  GeV)

Higgs properties are well known except its mass!

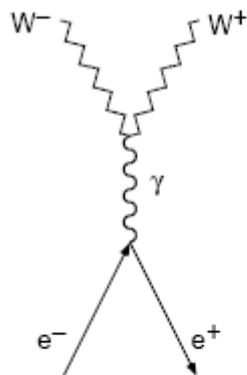

Direct searches:  $m_H > 114$  GeV

Examine energy dependence of scattering processes

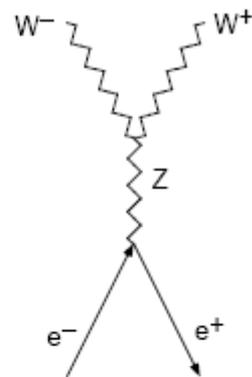

Process (a) and (b) are well behaved as energy increases

Process (c) becomes larger than total  $e^+e^-$  cross section! (unitarity is violated)

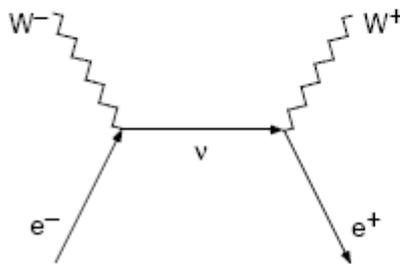

Higgs-like particle is needed to cancel  $e^+e^- \rightarrow W^+W^-$  scattering divergences

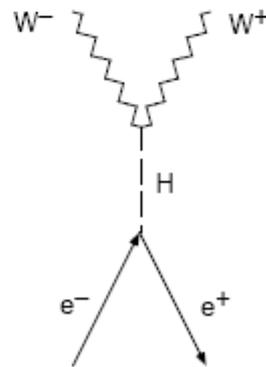

(a)

(b)

(c)

(d)

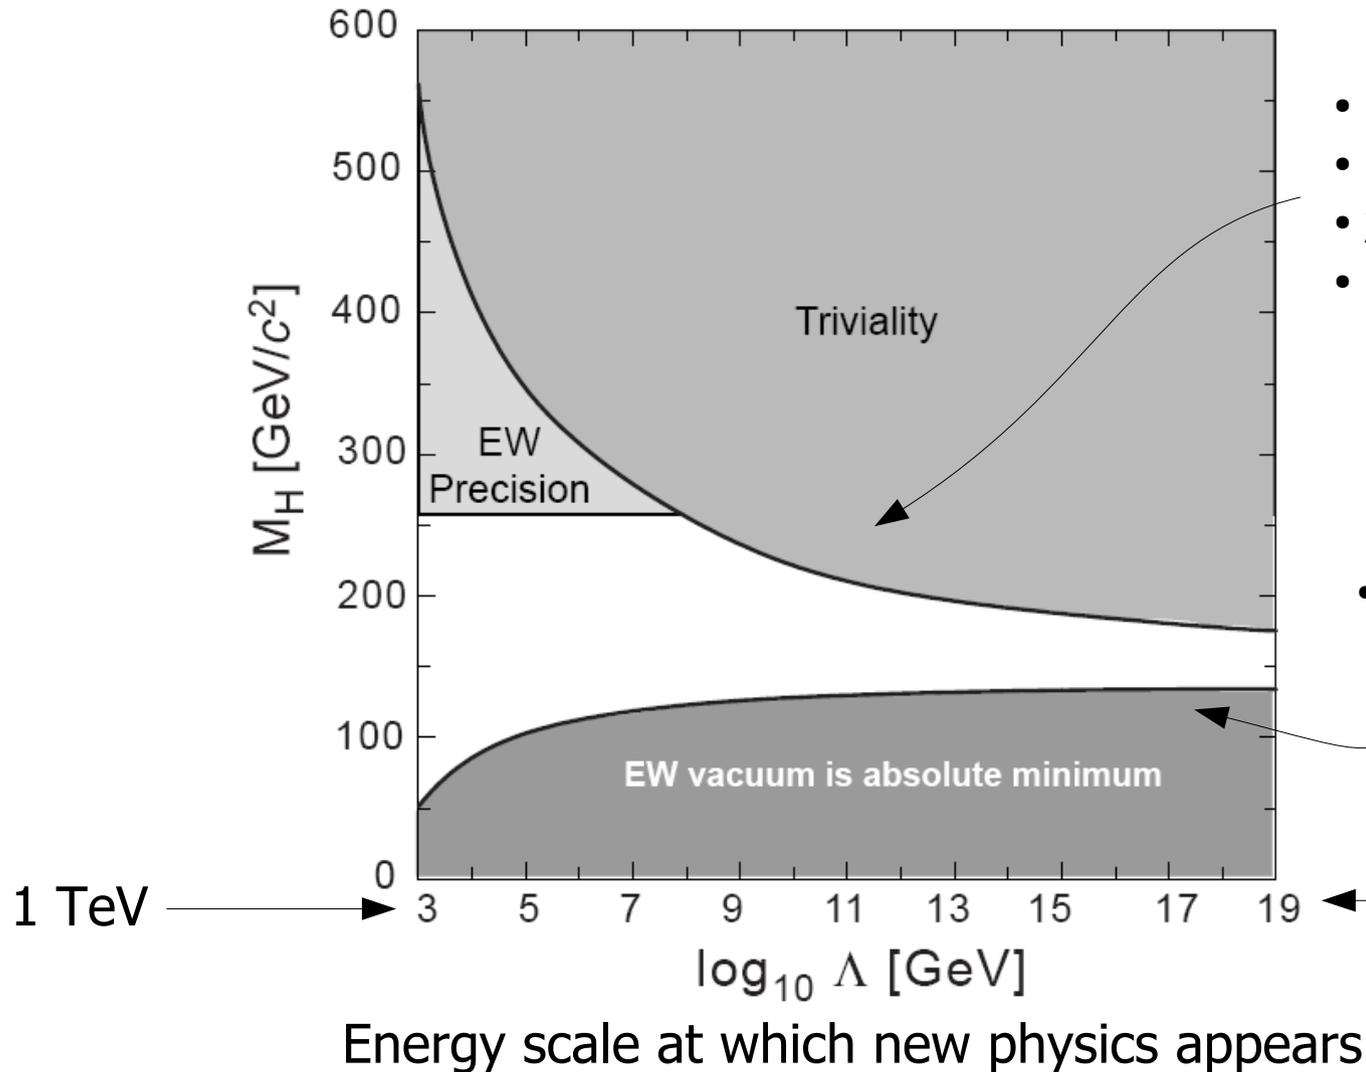

Requires Standard Model Higgs to be  $< \sim 1\text{TeV}$

If Standard Model is correct we will find the Higgs at the LHC!

If Standard Model is wrong some new particle must do this job

**win-win situation!**

Even if Standard Model Higgs doesn't exist, a Higgs-like particle must!  
 Place bounds on mass of Higgs-like particle by requiring self consistency of theory

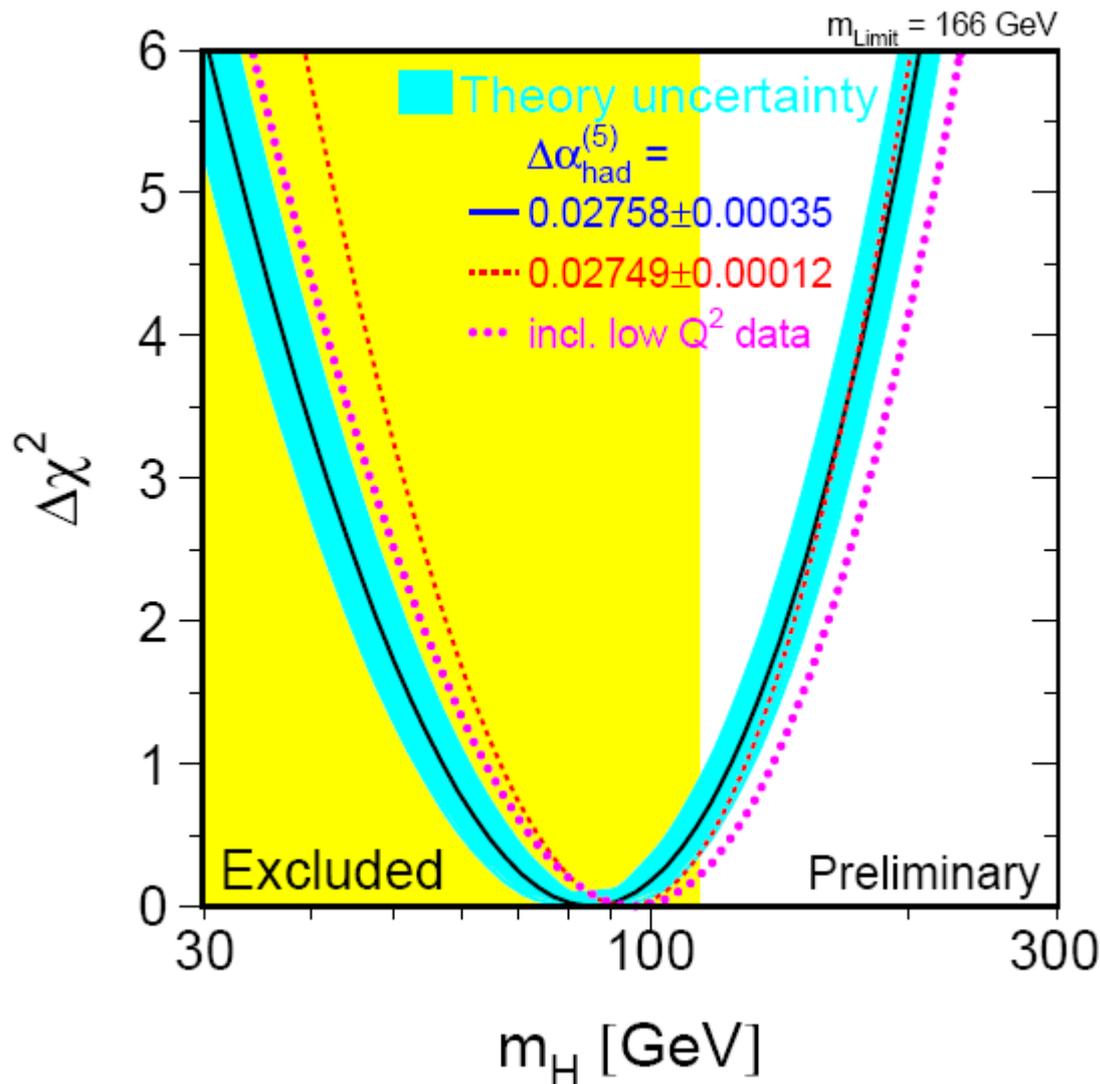

- Higgs self coupling =  $\lambda(Q)$
- $Q$  is energy at which you test
- $\lambda(Q)$  increases with  $Q$
- Requiring  $\lambda(Q)$  finite for  $Q < \Lambda$  fixes upper limit on  $M_H$

- Requiring  $\lambda(Q) > 0$  for  $Q < \Lambda$  fixes lower limit on  $M_H$

←  $10^{19}$  GeV !!!

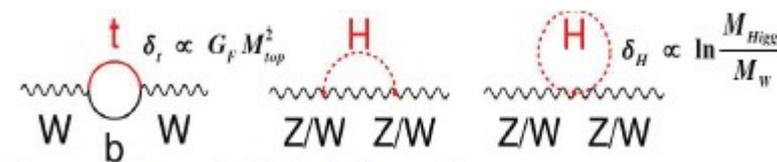

$\Lambda$  must be  $< 10^{19}$  GeV  
 scale at which gravity effects become important

But we should have already seen it!

Precise measurements at low energy are sensitive to Higgs loops

Perturbations on a perturbation!

Measurements at  $E < m_H$  are

logarithmically sensitive to  $m_H$

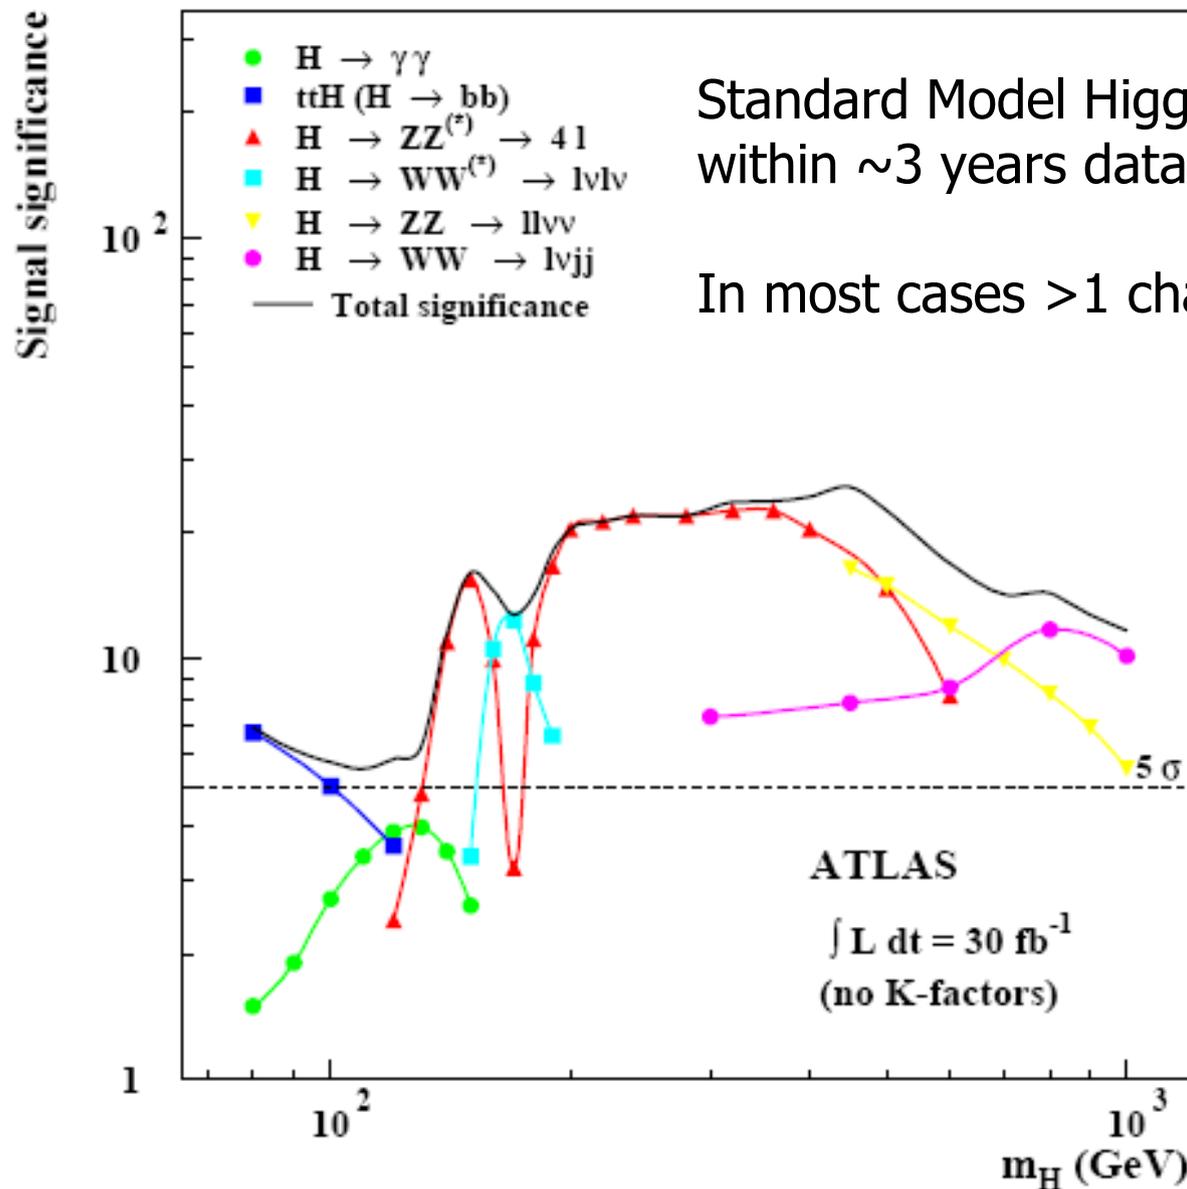

Confront data & theory:  $\chi^2$  test

Indicates light Higgs !

68% prob of SM Higgs in range  $85_{-28}^{+39}$  GeV

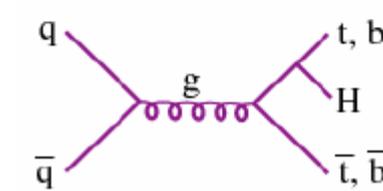

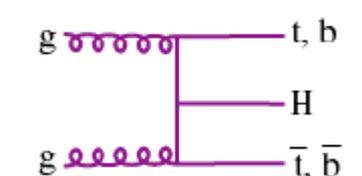

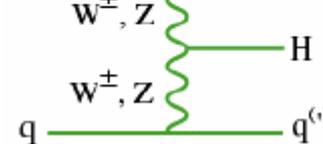

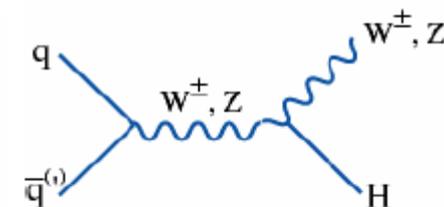

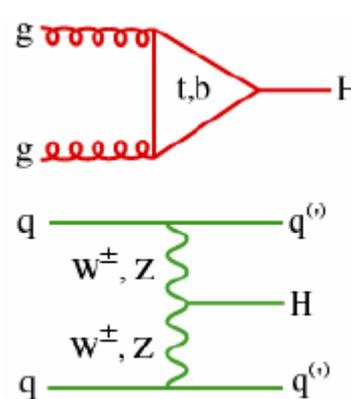

95% prob of SM Higgs  $< 166$  GeV

## Likelihood of NOT being a statistical fluctuation vs Higgs mass

Standard Model Higgs discovered over full mass range within  $\sim 3$  years data taking

In most cases  $>1$  channel for discovery

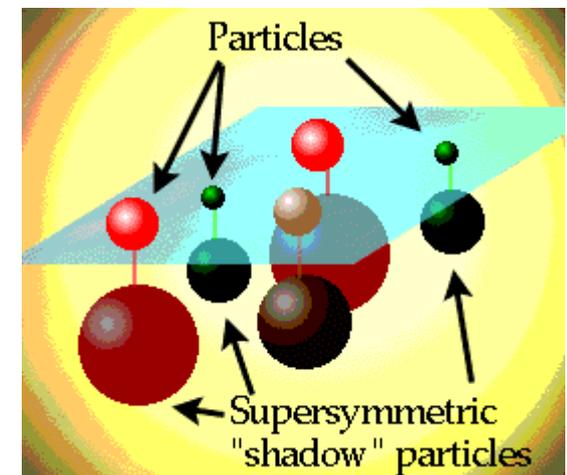

What are the alternatives to the Standard Model?

Best bet is Supersymmetry (SUSY)

Theoretically elegant - extends symmetry ideas of the Standard Model  
Invokes a symmetry between fermions and bosons  
(integer and half integer spin particles)

Immediately double number of particles  
Each SM particle has a superpartner sparticle

quarks (spin $\frac{1}{2}$ )	$\leftrightarrow$	squarks (spin 0)
leptons (spin $\frac{1}{2}$ )	$\leftrightarrow$	sleptons (spin 0)
photon (spin 1)	$\leftrightarrow$	photino (spin $\frac{1}{2}$ )
W,Z (spin 1)	$\leftrightarrow$	Wino, Zino (spin $\frac{1}{2}$ )
Higgs (spin 0)	$\leftrightarrow$	Higgsino (spin $\frac{1}{2}$ )

None of these has been observed

105 new parameters required by theory - So why bother??

- Naturally extends to quantum gravity
- Provides a candidate for dark matter
- SUSY solves hierarchy problem
- Brings about GUT unification of couplings
- Some general assumptions can reduce 10<sup>5</sup> parameters to 5

## What are GUTs?

Grand unified theories: quantum gravity

Expect this to occur at energy scales when couplings reach strength of gravity

Construct a quantity with dimensions of energy or length from constants of relativity, quantum mechanics & gravity:  $c$ ,  $\hbar$ ,  $G$

$$E_{planck} = \sqrt{\frac{\hbar c}{G}} = 10^{19} \text{ GeV} \quad L_{planck} = \sqrt{\frac{G \hbar}{c^3}} = 10^{-35} \text{ m}$$

## Dark Matter Candidates

Astronomical observation show that  $\sim 25\%$  of universe is dark matter

It should be cold (i.e. non-relativistic) and stable (does not decay)

Must be non-charged (or will interact with photons)

Must be only weakly interacting

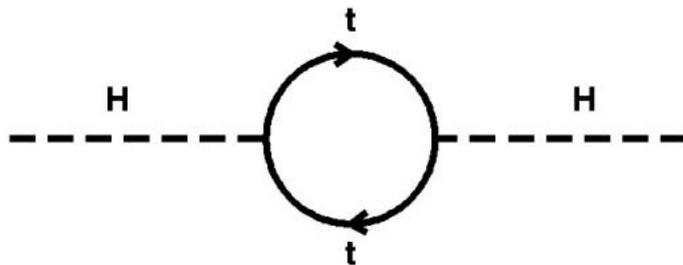

Cannot be neutrons - free neutrons decay

Cannot be neutrinos - mass too small

The lightest SUSY particle (LSP) is a prime dark matter candidate!

## Hierarchy Problem

Why is Higgs mass ( $\sim 1$  TeV) so much smaller than the Planck scale ( $10^{19}$  GeV)?  
Such calculations need to take account virtual fluctuations

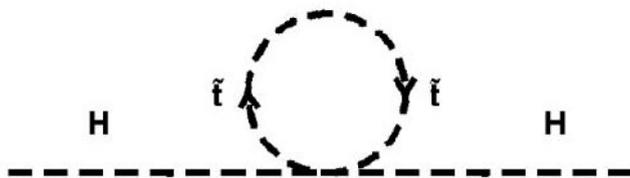

Higgs interacts with all spin  $\frac{1}{2}$  particle-antiparticle pairs in the vacuum

Higgs mass quantum corrections are quadratically divergent upto  $10^{19}$  GeV  
If SM valid upto Planck scale then incredible fine-tuning of cancellations is needed to ensure  $\sim 1$  TeV Higgs mass

Seems unnatural

Only a problem for the Higgs (only SM particle with spin 0)

New SUSY sparticles (e.g. stop squark) contribute and cancel identically

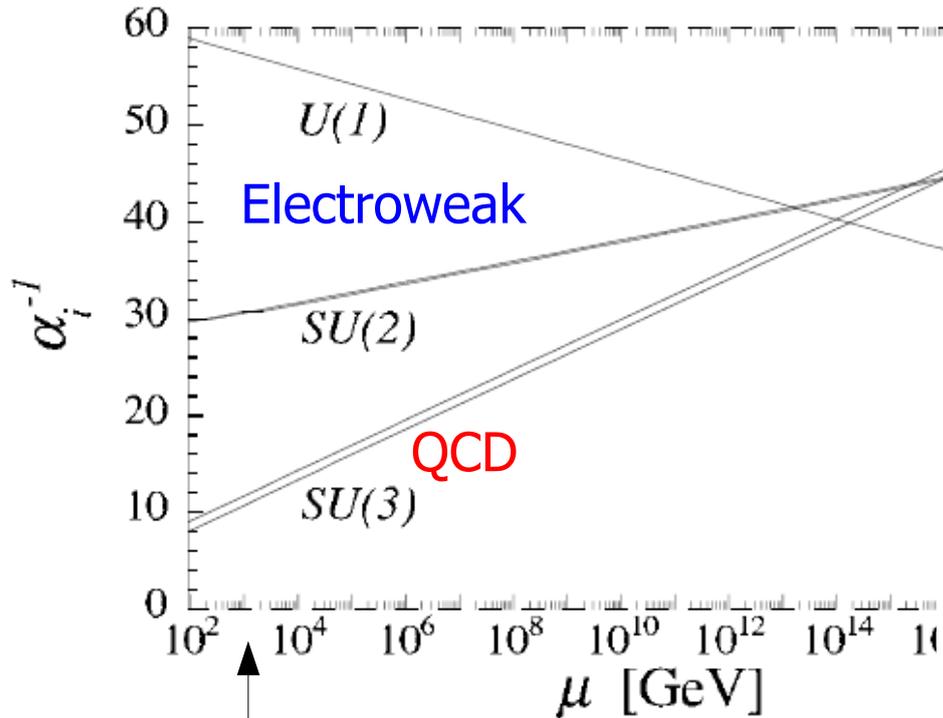

Higgs interaction with spin 0 sparticle cancels SM quantum corrections above

## GUT Unification

Another of SUSYs charms:

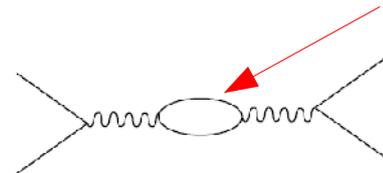

Coupling constants extrapolated to Planck scale do not intersect

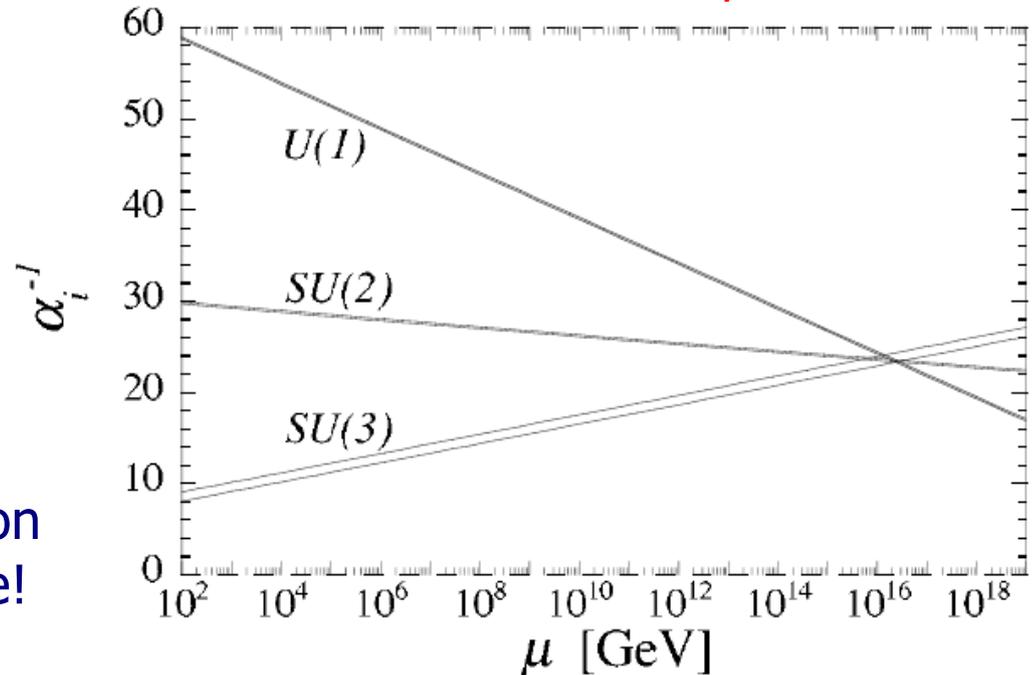

Current measurements

Incorporating SUSY into extrapolation brings unification below Planck scale!

16 orders of magnitude extrapolation!  
Involves including all particle loops

New SUSY particles = different loops  
= different extrapolation

## Quantum Gravity

Supersymmetry is a particular form of string theory

String theory aims to describe physics of Planck scale - domain of quantum gravity

Impossible to reach in any collider!

Some quantum gravity theories live in 10 or 11 dimensional space!

predict gravitons propagate in extra dimensions size of Planck length

(graviton = postulated force carrier of gravity)

Explains why gravity is  $10^{23}$  times weaker than Weak force - gravity is diluted

But: If extra dimensions large ( $\sim 0.1\text{mm}$ ) quantum gravity could be seen at TeV scale

Gravity has never been tested at such short distances!

LHC could open the possibility of creating mini-black holes & gravitons

laboratory for testing quantum gravity!!!

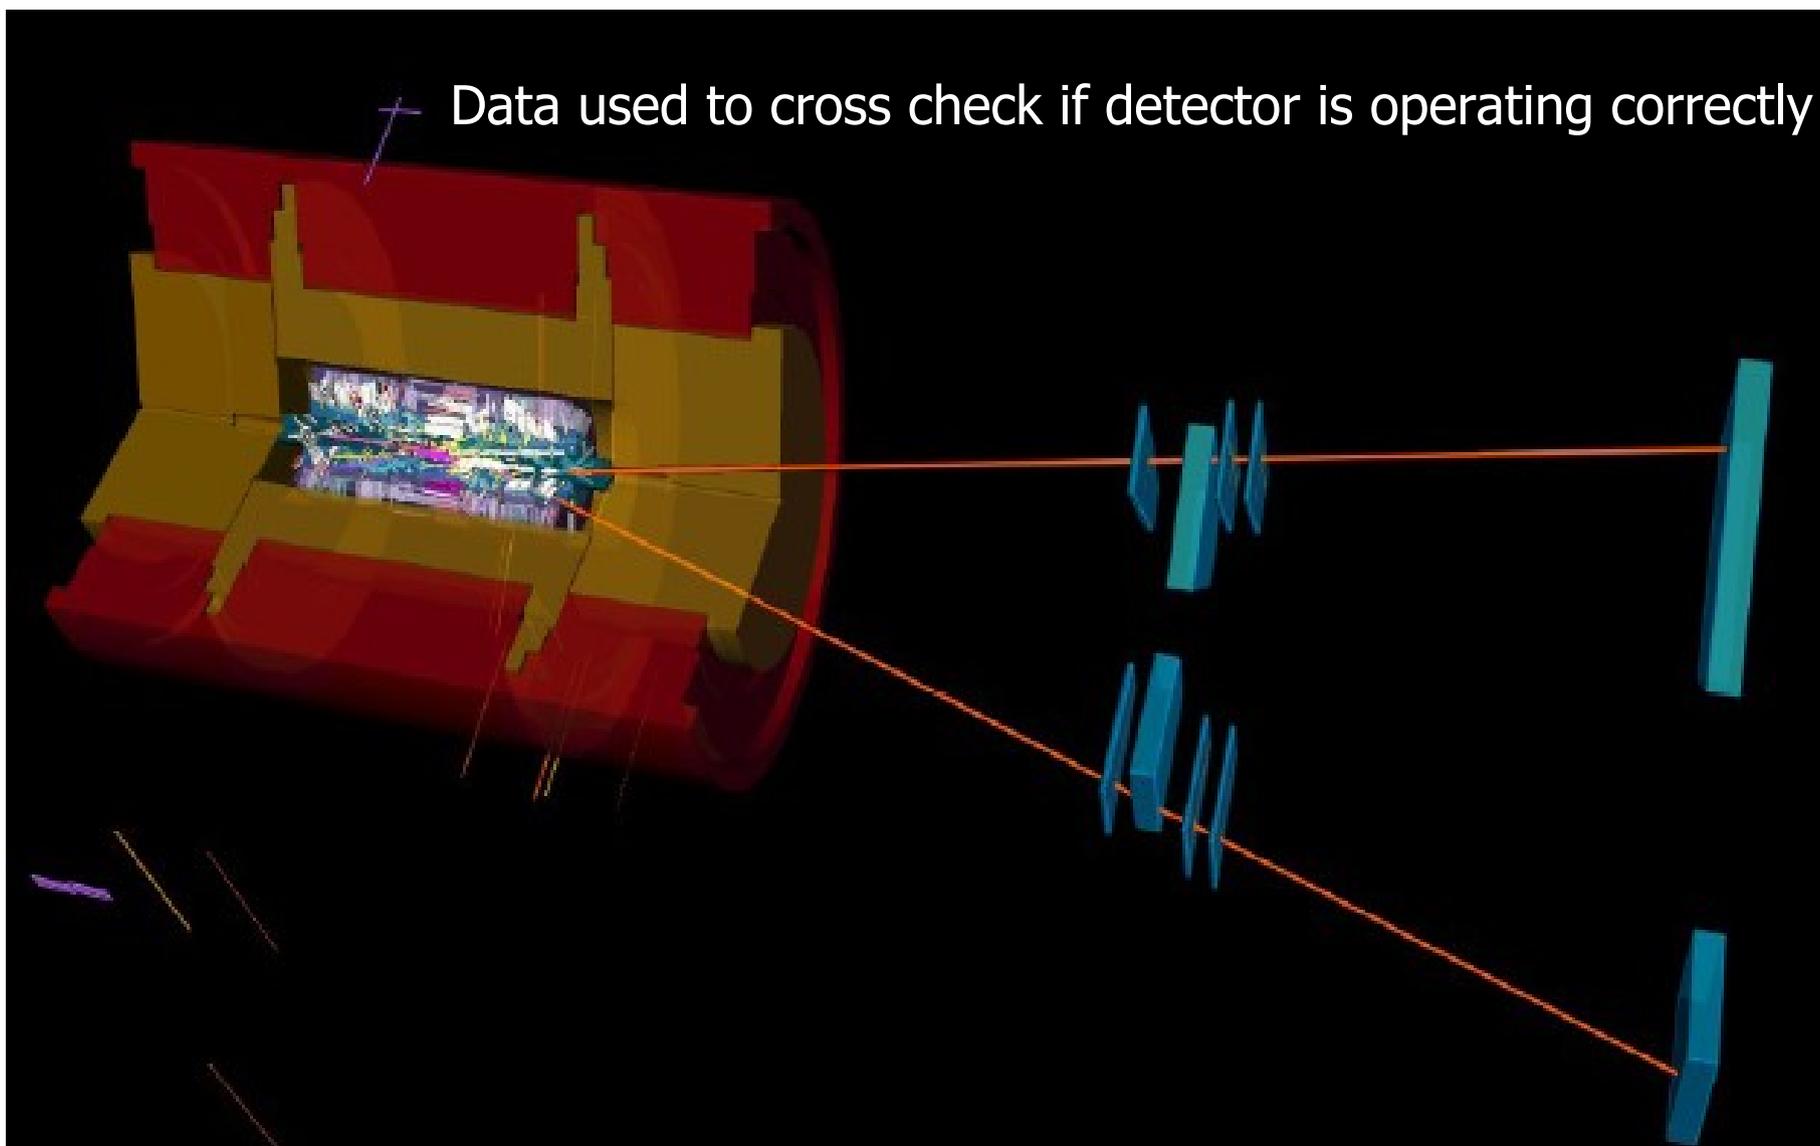

Mini black holes will evaporate via Hawking radiation

experimentally look for particle decays with Black Body spectrum at Hawking Temp

$$T \approx \frac{(n+1)}{4\pi R} \quad \begin{array}{l} n = \text{number of extra dimensions} \\ R = \text{radius of compacted dimension} \end{array}$$

Atlas Experiment sees collision data

Long "physics run" of data taking starts this Spring for  $\sim 1$  year!

We're living in exciting times

T2K may discover reasons for matter/anti-matter asymmetry in universe

Discovery potential of the LHC is huge

- Higgs discovery
- mini black holes
- extra dimensions
- supersymmetry
- new phases of matter
- quantum gravity
- secret of dark matter
- ... something we haven't thought of yet

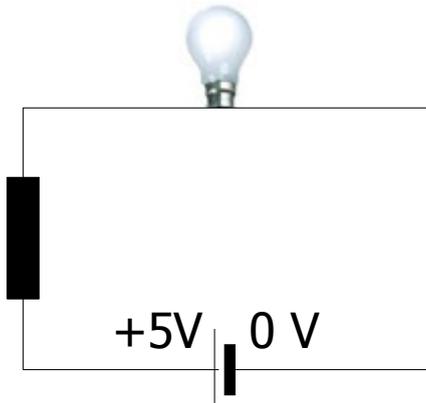

Lots of work to be done in next few years!

The LHC started operation November 2009

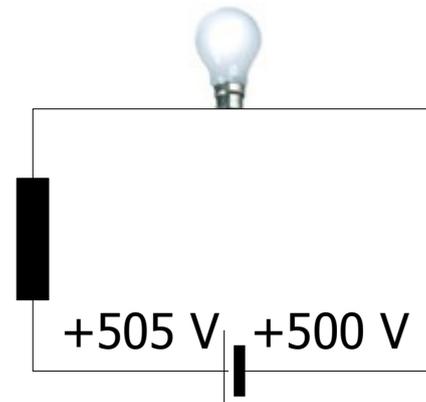

Data taking will start in earnest Feb 2010

T2K commenced operation in Japan

In just a few years you could be working with us!

A gauge transformation is one in which a symmetry transformation leaves the physics unchanged

Both circuits behave identically  
Circuit is only sensitive to potential differences  
Change the ground potential of the earth and see no difference!  
Leads to concept of charge conservation

In electromagnetism we are insensitive to phase  $\alpha$  of EM radiation  
Could globally change the phase at all points in universe: no difference  
global gauge transformation  
What happens if we demand local phase transformations?  $\alpha \rightarrow \alpha(x,t)$

If we demand local phase invariance AND consistent physics then we must alter Maxwell's equations

The alterations required to accommodate these changes introduce a new field - interaction of charged particle with an EM field - the photon!

This can be applied to many situations:

local gauge invariance introduces new fields & particles:

Electromagnetism	photon
Quantum chromodynamics	gluons
Weak force	$W^\pm$ and $Z^0$

Intimately related to symmetries and conservation laws
